

1. NAME OF THE MEDICINAL PRODUCT

Advil Liqui-Gels 200 mg

Advil Forte 400 mg

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each capsule of **Advil Liqui-gels 200** contains 200 mg Ibuprofen.

Each capsule of **Advil Forte 400** contains 400 mg Ibuprofen.

Excipients: sorbitol, lecithin blend

For a full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Advil Liqui-Gels 200

Liquid filled (Liqui-gels) green and soft capsules with the word 'Advil' printed on one side of each capsule in white ink.

Advil Forte 400

Oval capsule with a dye free, translucent gelatine shell, printed with '400' in black ink, and contains a clear liquid fill.

4. CLINICAL PARTICULARS

4.1. Therapeutic indications

For the relief of mild to moderate pain associated with headache, toothache, backache, muscular and menstrual pains.

Antipyretic. Anti-inflammatory for rheumatic diseases. For the treatment of pain associated with migraine.

4.2. Posology and method of administration

For oral administration and short-term use only.

The lowest effective dose should be used for the shortest duration necessary to relieve symptoms (see section 4.4).

For all indications:

Adults, older people and children and adolescents between 12-18 years of age:

If in children or adolescents between 12 -18 years of age, this medicinal product is required for more than 3 days, or if symptoms worsen, a doctor should be consulted.

For adults aged 18 years or older, the lowest effective dose should be used for the shortest duration necessary to relieve symptoms and minimise undesirable effects (see section 4.4).

The patient should consult a doctor if symptoms persist or worsen, or if the product is required for more than 10 days.

1 Capsule of Advil Forte 400 or 1 or 2 capsules of Advil Liqui-Gels 200 up to three times per day as required. The respective dosing interval should be chosen in line with the observed symptoms and the maximum recommended daily dose. Doses should be given approximately every 6-8 hours, with a minimum interval of 4 hours between each dose. A total dose of 1200 mg of ibuprofen (6 capsules of Advil Liqui-Gels 200 and 3 capsules of Advil Forte 400-) should not be exceeded in any 24 hour period. The capsules should be taken with water.

Not to be used for children under 12 years of age.

4.3. Contraindications

Hypersensitivity to ibuprofen or any of the excipients listed in section 6.1.

Use in patients hypersensitive to aspirin or with bronchospasm, asthma, rhinitis, angioedema or urticaria associated with non-steroidal anti-inflammatory drugs (NSAIDs).

Ibuprofen should not be given to patients with active or history of recurrent peptic ulcer/haemorrhage (two or more distinct episodes of proven ulceration or bleeding).

History of gastrointestinal bleeding or perforation related to previous NSAID therapy.

Cerebrovascular bleeding, other active bleeding, or haematological disease.

Severe hepatic failure, severe renal failure or severe heart failure (NYHA Class IV).

Last trimester of pregnancy (see section 4.6).

4.4. Special warnings and precautions for use

Undesirable effects may be minimised by using the lowest effective dose for the shortest duration necessary to control symptoms (see gastrointestinal and cardiovascular risks below).

Older people:

Older people have an increased frequency of adverse reactions to NSAIDs, especially gastrointestinal bleeding and perforation which may be fatal.

Respiratory:

Bronchospasm may be precipitated in patients suffering from or with a previous history of bronchial asthma or allergic disease and Advil Liqui-Gels 200 and Advil Forte 400 mg should not be used where other NSAIDs have produced reactions.

Other NSAIDs:

The use of Advil Liqui-Gels 200 and Advil Forte 400 mg with concomitant NSAIDs including cyclooxygenase-2 selective inhibitors should be avoided (see section 4.5).

Systemic Lupus Erythematosus (SLE) and mixed connective tissue disease:

Caution should be taken when ibuprofen is given to patients with SLE and autoimmune diseases – increased risk of aseptic meningitis has been reported. (see section 4.8).

Renal, Cardiac and Hepatic:

Caution is required in patients with renal, cardiac or hepatic impairment since renal function may deteriorate (see sections 4.3 and 4.8). The dose should be as low as possible and renal function should be monitored.

There is a risk of renal impairment in dehydrated children or adolescents between 12 -18 years of age.

Cardiovascular and cerebrovascular effects:

Caution (discussion with doctor or pharmacist) is required prior to starting treatment in patients with a history of hypertension and/or heart failure as fluid retention, hypertension and oedema have been reported in association with NSAID therapy.

Clinical studies suggest that use of ibuprofen, particularly at high doses (2400mg/day) may be associated with a small increased risk of arterial thrombotic events (for example myocardial infarction or stroke). Overall, epidemiological studies do not suggest that low dose ibuprofen (e.g. \leq 1200mg/day) is associated with an increased risk of arterial thrombotic events.

Patients with uncontrolled hypertension, congestive heart failure (NYHA II-III), established ischaemic heart disease, peripheral arterial disease, and/or cerebrovascular disease should only be treated with ibuprofen after careful consideration and high doses (2400 mg/day) should be avoided.

Careful consideration should also be exercised before initiating long-term treatment of patients with risk factors for cardiovascular events (e.g. hypertension, hyperlipidaemia, diabetes mellitus and smoking), particularly if high doses of ibuprofen (2400 mg/day) are required.

Cases of Kounis syndrome have been reported in patients treated with Advil Liqui-Gels 200 and Advil Forte 400 mg. Kounis syndrome has been defined as cardiovascular symptoms secondary to an allergic or hypersensitive reaction associated with constriction of coronary arteries and potentially leading to myocardial infarction.

Impaired female fertility:

There is limited evidence that drugs which inhibit cyclo-oxygenase/prostaglandin synthesis may cause impairment of female fertility by an effect on ovulation. This is reversible upon withdrawal of treatment.

Gastrointestinal:

NSAIDs should be given with care to patients with a history of gastrointestinal disease (e.g. ulcerative colitis, Crohn's disease) as these conditions may be exacerbated (see section 4.8).

GI bleeding, ulceration or perforation, which can be fatal, has been reported with all NSAIDs at any time during treatment, with or without warning symptoms or a previous history of serious GI events.

The risk of GI bleeding, ulceration or perforation is higher with increasing NSAID doses in patients with a history of ulcer, particularly if complicated with haemorrhage or perforation (see section 4.3), and in the elderly. These patients should commence treatment on the lowest dose available.

Patients with a history of GI toxicity, particularly when elderly, should report any unusual abdominal symptoms (especially GI bleeding), particularly in the initial stages of treatment. Caution should be advised in patients receiving concomitant medications which could increase the risk of ulceration or bleeding, such as oral corticosteroids, anticoagulants such as warfarin, selective serotonin-reuptake inhibitors (SSRIs) or anti-platelet agents such as aspirin (see section 4.5).

When GI bleeding or ulceration occurs in patients receiving ibuprofen, the treatment should be withdrawn.

Dermatological:

Severe skin reactions

Severe cutaneous reactions (SCARs):

Severe cutaneous reactions (SCARs), including exfoliative dermatitis, erythema multiforme, Stevens-Johnson syndrome (SJS), Toxic Epidermal Necrolysis (TEN), Drug Reaction with Eosinophilia and Systemic Symptoms (DRESS syndrome) and acute generalized exanthematous pustulosis (AGEP), which can be life-threatening or fatal, have been reported in association with the use of ibuprofen (see section 4.8). Most of these reactions occurred within the first month.

If signs and symptoms suggestive of these reactions appear. Advil Liqui-Gels 200 and Advil Forte 400 should be withdrawn immediately and an alternative treatment considered (as appropriate)

Exceptionally, varicella can be at the origin of serious cutaneous and soft tissue infectious complications. To date, the contributing role of NSAIDs in the worsening of these infections cannot be ruled out. Thus, it is advisable to avoid use of Advil Liqui-Gels 200 mg and Advil Forte 400 mg in case of varicella.

Masking of symptoms of underlying infections

Advil Liqui-gels 200 and Advil Forte 400 can mask symptoms of infection, which may lead to delayed initiation of appropriate treatment and thereby worsening the outcome of the infection. This has been observed in bacterial community acquired pneumonia and bacterial complications to varicella. When Advil Liqui-gels 200 and Advil Forte 400 are administered for fever or pain relief in relation to infection, monitoring of infection is advised. In non-hospital settings, the patient should consult a doctor if symptoms persist or worsen.

The pharmacological activity of ibuprofen may reduce fever and inflammation, thus diminishing their utility as diagnostic signs in detecting underlying conditions.

Advil Liqui-gel 200 and Advil Forte 400 contain sorbitol.

Patients with rare hereditary problems of fructose intolerance should not take this medicine.

Advil Liqui-gels 200 and Advil Forte 400 Capsules contain soya lecithin. If you are allergic to peanut or soya, do not use this medicinal product.

4.5. Interactions with other medicinal products and other forms of interaction Ibuprofen should be avoided in combination with:

Aspirin:

Concomitant administration of ibuprofen and aspirin is not generally recommended because of the potential of increased adverse effects.

Experimental data suggest that ibuprofen may competitively inhibit the effect of low dose aspirin on platelet aggregation when they are dosed concomitantly. Although there are uncertainties regarding extrapolation of these data to the clinical situation, the possibility that regular, long-term use of ibuprofen, may reduce the cardioprotective effect of low-dose aspirin cannot be excluded. No clinically relevant effect is considered to be likely for occasional ibuprofen use (see section 5.1).

Other NSAIDs:

Ibuprofen should not be used with other pain relievers such as NSAIDs.

Ibuprofen should be used with caution in combination with:

Anticoagulants: NSAIDs may enhance the effects of anticoagulants such as warfarin (see section 4.4).

When taking anticoagulants it should be taken into account that long-term use of ibuprofen may increase the risk of bleeding.

Antihypertensives and diuretics: NSAIDs may diminish the effects of antihypertensives or thiazide diuretics. Diuretics can increase the risk of nephrotoxicity of NSAIDs.

Corticosteroids: When taking corticosteroids and ibuprofen concomitantly there is an increased risk of gastrointestinal ulceration or bleeding. (see section 4.4).

Anti-platelet agents and selective serotonin reuptake inhibitors (SSRIs): Increased risk of gastrointestinal bleeding (see section 4.4)

Cardiac glycosides: Ibuprofen may increase serum digitalis concentrations. Serum digitalis concentrations should therefore be monitored in patients with decreased renal function or congestive heart failure.

Lithium: Increases in serum lithium concentrations following administration of ibuprofen may be clinically significant.

Methotrexate: Concomitant administration of ibuprofen with moderate and high doses of methotrexate may lead to serious and fatal methotrexate toxicity. Patients with reduced renal function may be at additional risk of toxicity from the combination even when low doses of methotrexate (≤ 20 mg/week) are used.

Ciclosporin: Increased risk of nephrotoxicity.

Tacrolimus: Possible increased risk of nephrotoxicity when NSAIDs are given with tacrolimus.

Zidovudine: Increased risk of haematological toxicity when NSAIDs are given with zidovudine. There is evidence of an increased risk of haemarthroses and haematoma in HIV(+) haemophiliacs receiving concurrent treatment with zidovudine and ibuprofen.

Quinolone antibiotics: Animal data indicate that NSAIDs can increase the risk of convulsions associated with quinolone antibiotics. Patients taking NSAIDs and quinolones may have an increased risk of developing convulsions.

Phenytoin: Ibuprofen may increase pharmacologically active free phenytoin. Patients taking ibuprofen for long-term use should be monitored.

Antacids: Certain antacids may increase the gastrointestinal absorption of ibuprofen. This is considered to be of clinical relevance particularly during long-term use of ibuprofen.

4.6 Fertility, pregnancy and lactation

Pregnancy

Inhibition of prostaglandin synthesis may adversely affect the pregnancy and/or the embryo/foetal development. Data from epidemiological studies suggest an increased risk of miscarriage and of cardiac malformation and gastroschisis after use of a prostaglandin synthesis inhibitor in early pregnancy. The absolute risk for cardiovascular malformation was increased from less than 1%, up to approximately 1.5 %. The risk is believed to increase with dose and duration of therapy. In animals, administration of a prostaglandin synthesis inhibitor has been shown to result in increased pre- and post-implantation loss and embryo-foetal lethality. In addition, increased incidences of various malformations, including cardiovascular, have been reported in animals given a prostaglandin synthesis inhibitor during the organogenetic period. From the 20th week of pregnancy onward Advil Liqui-gel 200 and Advil Forte 400 use may cause oligohydramnios resulting from foetal renal dysfunction. This may occur shortly after treatment initiation and is usually reversible upon discontinuation. In addition, there have been reports of ductus arteriosus constriction following treatment in the second trimester, most of which resolved after treatment cessation. Therefore, during the first and second trimester of pregnancy, ibuprofen should not be given unless clearly necessary. If ibuprofen is used by a woman attempting to conceive, or during the first and second trimester of pregnancy, the dose should be kept as low and duration of treatment as short as possible. Antenatal monitoring for oligohydramnios and ductus arteriosus constriction should be considered after exposure to Advil Liqui-gel 200 and Advil Forte 400 for several days from gestational week 20 onward. Advil Liqui-gel 200 and Advil Forte 400 should be discontinued if oligohydramnios or ductus arteriosus constriction are found.

During the third trimester of pregnancy, all prostaglandin synthesis inhibitors may expose the foetus to:

- cardiopulmonary toxicity (premature constriction/ closure of the ductus arteriosus and pulmonary hypertension);
- renal dysfunction (see above), which may progress to renal failure with oligohydroamniosis;

the mother and the neonate, at the end of pregnancy, to:

- possible prolongation of bleeding time, an anti-aggregating effect which may occur even at very low doses.

- inhibition of uterine contractions resulting in delayed or prolonged labour.

Consequently, ibuprofen is contraindicated during the third trimester of pregnancy.

(See sections 4.3 and 5.3).

Lactation

In limited studies, ibuprofen appears in breast milk in very low concentrations. Based upon the low level detected (0.0008% of maternal dose), it is unlikely to affect the breast-fed infant adversely.

Fertility

See section 4.4 regarding female fertility.

4.7. Effects on ability to drive and use machines

No studies on the effect of ability to drive or use machines have been performed.

4.8. Undesirable effects

The following list of adverse effects relates to those experienced with ibuprofen at OTC doses, for short term use. In the treatment of chronic conditions, under long-term treatment, additional adverse effects may occur.

The adverse effects have been listed in order of decreasing frequency, using the following convention:
 very common ($\geq 1/10$); common ($\geq 1/100$ to $<1/10$); uncommon ($\geq 1/1,000$ to $<1/100$); rare ($\geq 1/10,000$ to $<1/1,000$); very rare $<1/10,000$), not known (cannot be estimated from the available data).

Investigations:	Very rare:	Decreased haematocrit and haemoglobin levels.
Cardiac Disorders:	Not known:	Oedema, hypertension, angina pectoris and cardiac failure, have been reported in association with NSAID treatment. Kounis syndrome. Clinical studies suggest that use of ibuprofen (particularly at a high dose (2400mg/day) may be associated with a small increased risk of arterial thrombotic events (for example myocardial infarction or stroke) (see section 4.4).
Blood and Lymphatic System Disorders:	Very rare:	Haematopoietic disorders (anaemia, haemolytic anaemia, aplastic anaemia, leucopenia, thrombocytopenia, pancytopenia, agranulocytosis). First signs are: fever, sore throat, superficial mouth ulcers, influenza-like symptoms, severe exhaustion, unexplained bleeding and bruising.
Nervous System Disorders:	Uncommon:	Headache, dizziness, cerebrovascular accident
	Very rare:	Aseptic meningitis – single cases have been reported very rarely.
Eye Disorders:	Very rare:	Visual impairment
Ear and Labyrinth Disorders:	Very rare:	Tinnitus and vertigo.
Respiratory, Thoracic and Mediastinal Disorders:	Very rare:	Asthma, bronchospasm, dyspnoea and wheezing.
Gastrointestinal Disorders:		The most commonly-observed adverse events

		are gastrointestinal in nature.
	Uncommon:	Abdominal pain, abdominal distension, nausea and dyspepsia.
	Rare:	Diarrhoea, flatulence, constipation and vomiting.
	Very rare:	Peptic ulcer, perforation or gastrointestinal haemorrhage, melaena, haematemesis, sometimes fatal, particularly in the elderly, ulcerative stomatitis, gastritis, mouth ulcer.
	Not known:	Exacerbation of colitis and Crohn's disease (see section 4.4).
Renal and Urinary Disorders:	Very rare:	Acute renal failure, tubulointerstitial nephritis, nephritic syndrome, papillary necrosis, especially in long-term use, associated with increased serum urea and oedema; haematuria and proteinuria.
Skin and Subcutaneous Tissue Disorders:	Uncommon:	Various skin rashes
	Very rare:	Severe cutaneous adverse reactions (SCARs) (including Erythema multiforme, exfoliative dermatitis, Stevens-Johnson Syndrome, and toxic epidermal necrolysis).
	Not known:	Drug reaction with eosinophilia and systemic symptoms (DRESS syndrome) Acute generalised exanthematous pustulosis (AGEP) Photosensitivity reactions.
Infections and Infestations:	Not known:	Meningitis, aseptic meningitis.
Vascular Disorders:	Very rare:	Hypertension.
General Disorders and Administration Site Conditions:	Very rare:	Oedema, swelling and peripheral oedema.

Immune System Disorders:	Uncommon:	Hypersensitivity reactions with urticaria and pruritis.
	Very rare:	Severe hypersensitivity reactions. Symptoms could be: facial, tongue and laryngeal swelling, dyspnoea, tachycardia, hypotension (anaphylaxis, angioedema or severe shock).
	Not known:	Non-specific allergic reactions Respiratory tract reactivity (e.g. asthma, aggravated asthma and bronchospasm). Various skin reactions including exfoliative and bullous dermatoses (including epidermal necrolysis and erythema multiforme). In patients with existing auto-immune disorders (such as systemic lupus erythematosus, mixed connective tissue disease) during treatment with ibuprofen, single cases of symptoms of aseptic meningitis, such as stiff neck, headache, nausea, vomiting, fever or disorientation have been observed (see section 4.4).
Hepatobiliary Disorders:	Very rare:	Liver disorders, hepatitis and jaundice.
Psychiatric Disorders:	Very rare:	Nervousness.

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Any suspected adverse events should be reported to the Ministry of Health according to the National Regulation by using an online form <https://sideeffects.health.gov.il>)

4.9. Overdose

In children ingestion of more than 400 mg/kg may cause symptoms. In adults the dose response effect is less clear cut. The half-life in overdose is 1.5 – 3 hours.

Symptoms

Most patients who have ingested clinically important amounts of NSAIDs will develop no more than nausea, vomiting, epigastric pain, or more rarely diarrhoea. Tinnitus, headache and gastrointestinal bleeding are also possible. In more serious poisoning, toxicity is seen in the

central nervous system, manifesting as drowsiness, occasionally excitation, hypotension and disorientation or coma.

Occasionally patients develop convulsions. In serious poisoning metabolic acidosis may occur and the prothrombin time/INR may be prolonged, probably due to interference with the actions of circulating clotting factors. Acute renal failure and liver damage may occur. Exacerbation of asthma is possible in asthmatics.

Management

Management should be symptomatic and supportive and include the maintenance of a clear airway and monitoring of cardiac and vital signs until stable. Consider oral administration of activated charcoal if the patient presents within 1 hour of ingestion of a potentially toxic amount. If frequent or prolonged, convulsions should be treated with intravenous diazepam or lorazepam. Give bronchodilators for asthma.

5. PHARMACOLOGICAL PROPERTIES

5.1. Pharmacodynamic properties

Pharmacotherapeutic group: Propionic acid derivatives

ATC code: M01A E01

Ibuprofen is a propionic acid derivative NSAID that has demonstrated its efficacy by inhibition of prostaglandin synthesis. In humans ibuprofen reduces inflammatory pain, swellings and fever.

Furthermore, ibuprofen reversibly inhibits platelet aggregation.

Clinical evidence demonstrates that when 400 mg of ibuprofen are taken, pain relieving effects can last for up to 8 hours.

Experimental data suggest that ibuprofen may competitively inhibit the effect of low dose aspirin on platelet aggregation when they are dosed concomitantly. Some pharmacodynamic studies show that when single doses of ibuprofen 400mg were taken within 8 hours before or within 30 minutes after immediate release aspirin dosing (81mg), a decreased effect of aspirin on the formation of thromboxane or platelet aggregation occurred. Although there are uncertainties regarding extrapolation of these data to the clinical situation, (for) the possibility that regular, long-term use of ibuprofen may reduce cardioprotective effect of low-dose aspirin cannot be excluded. No clinically relevant effect is considered to be likely for occasional ibuprofen use (see section 4.5).

5.2. Pharmacokinetic properties

After oral administration, solubilized ibuprofen (as present in Liquigel Capsules) is quickly absorbed when administered under fasting conditions. C_{max} is achieved within 0.6 hours compared to conventional tablets ($\frac{3}{4}$ – 1½ hours). When taken with food, peak levels are observed after 1-2 hours.

Ibuprofen protein binding is approximately 99%. After an oral dose, ibuprofen is 75 – 85% excreted in the urine during the first 24 hours (mainly in the form of two metabolites), the remainder being eliminated in the faeces following excretion in bile. Excretion is complete within 24 hours.

The half-life of ibuprofen in plasma is approximately 2 hours.

In limited studies, ibuprofen appears in the breast milk in very low concentrations.

5.3. Preclinical safety data

Preclinical data reveal no special hazard for humans based on conventional studies on safety pharmacology, repeated dose toxicity, genotoxicity and carcinogenic potential. No teratogenic effect has been demonstrated in animal experiments, however, use of ibuprofen during pregnancy should, if possible, be avoided.

Preclinical effects were observed only at exposures considered sufficiently in excess of the maximum human exposure, indicating little relevance to clinical use.

6. PHARMACEUTICAL PARTICULARS

6.1. List of excipients

Advil Liqui-gel 200

Polyethylene glycol 600

Gelatin (Type 150)

Sorbitan Sorbitol Solution (contains purified water, sorbitan, D-sorbitol)

Potassium hydroxide

Purified water

FD&C Green no.3

Ink [White Opacode (WB): Ammonium Hydroxide, Isopropyl alcohol, Purified water, Macrogol 400, Polyvinyl acetate phthalate, Propylene glycol, SDA 35A alcohol, Titanium dioxide]

Lecithin blend/ fractionated coconut oil

Advil Forte 400

Macrogol 600

Gelatin

Purified water

Sorbitol liquid, partially dehydrated

Potassium hydroxide 50% w/w solution

Opacode black ink (ethanol and ethyl acetate, propylene glycol (E1520), black iron oxide (E172), polyvinyl acetate phthalate, purified water, isopropyl alcohol, macrogol 400, aluminium hydroxide)

Triglycerides, medium chain

Phosal solution in ethanol

Lecithin in triglycerides (medium chain).

6.2. Incompatibilities

Not applicable.

6.3. Shelf life

The expiry date of the product is indicated on the packaging materials.

6.4. Special precautions for storage

Store below 25°C.

6.5. Nature and contents of container

The Advil Liqui-Gels 200 capsules are packed in plastic bottles and are available in the following pack sizes: 16 capsules per bottle (GSL presentation), 20 capsules per bottle, 40 capsules per bottle and 80 capsules per bottle.

Advil Forte 400 are packed into blister strips in a cardboard box.

Pack A: Blister: White opaque thermoformed unplasticised PVC (250 µm) / Polyethylene extrusion coating (30 µm) / PVdC (90 gsm) heat sealed to the foil.

A pack range will consist of packs of 4, 6, 8, 10, 12, 16, 20, 24, 30, 32, 36, 48, 50, 60, 96 and 100 Liquigel capsules.

Not all pack sizes may be marketed.

6.6. Special precautions for disposal

No special requirements.

7. REGISTRATION HOLDER AND IMPORTER:

Haleon CH Israel,

P.O.B 3256, Petach Tikva, 4951038

8. MARKETING AUTHORISATION NUMBER

Advil liqui-Gels:115-33-29761-21

Advil Forte :145-20-32014-00

Revised in June 2024.
