NOVARTIS

2026 ינואר

רופא/ה נכבד/ה, רוקח/ת נכבד/ה,

שלום רב,

הנדון **<u>תוספת התוויה ועידכון משטר מינון של התכשיר:</u>**

Kisqali 200 mg/ קיסקלי 200 מ"ג

Film Coated Tablets/ טבליות מצופות

חברת נוברטיס ישראל בע"מ מבקשת להודיע על תוספת התוויה, עידכון להתוויה הרשומה ועידכון משטר המינון של התכשיר Kisqali 200 mg. כמו כן, נעשו שינויים נוספים בעלון.

עקב ריבוי השינויים בעלונים, העלונים מצורפים במלואם. למידע מלא יש לעיין בעלוני התכשיר.
העלון נשלח לפרסום במאגר התרופות שבאתר משרד הבריאות, וניתן לקבלו מודפס על-ידי פניה לבעל הרישום.

כמו כן, ברצוננו לעדכן כי עודכן חומר האריזה הראשוני של התכשיר (הבליסטר).

התוויות התכשיר הרשומות:

Kisqali is indicated in combination with:

- a non-steroidal aromatase inhibitor for the treatment of pre/perimenopausal or postmenopausal women, with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer, as initial endocrine-based therapy; or

- fulvestrant for the treatment of men and postmenopausal women with HR-positive, HER2-negative advanced or metastatic breast cancer, as initial endocrine-based therapy or following disease progression on endocrine therapy.

ההתוויות לאחר עידכונן:

<u>Early breast cancer</u>
<u>Kisqali in combination with an aromatase inhibitor is indicated for the adjuvant treatment of patients with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative early breast cancer at high risk of recurrence.</u>

<u>In pre- or perimenopausal women, or in men, the aromatase inhibitor should be combined with a luteinising hormone-releasing hormone (LHRH) agonist.</u>

<u>Advanced or metastatic breast cancer</u>
Kisqali is indicated in combination with:

- a non-steroid aromatase inhibitor for the treatment of pre/perimenopausal or postmenopausal women, with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer, as initial endocrine-based therapy; or

- fulvestrant for the treatment of men and postmenopausal women with HR-positive, HER2-negative advanced or metastatic breast cancer, as initial endocrine-based therapy or following disease progression on endocrine therapy.

<u>In pre- or perimenopausal women, the endocrine therapy should be combined with a LHRH agonist.</u>

חומר פעיל:

Ribociclib (as succinate) 200 mg

בברכה,

נוברטיס ישראל בע"מ

Novartis Israel Ltd.
6 Tozeret Haaretz street, Tel Aviv P.O.Box 9240
Tel: 972-3-9201111

1. NAME OF THE MEDICINAL PRODUCT

Kisqali 200 mg

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each film-coated tablet contains ribociclib succinate, equivalent to 200 mg ribociclib.

Excipients with known effect

Each film-coated tablet contains 0.344 mg soya lecithin.

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Film-coated tablet.

Light greyish violet, unscored, round, curved with bevelled edges (approximate diameter: 11.1 mm), debossed with “RIC” on one side and “NVR” on the other side.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Early breast cancer

Kisqali in combination with an aromatase inhibitor is indicated for the adjuvant treatment of patients with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative early breast cancer at high risk of recurrence (see sections 4.2 and 5.1 for selection criteria).

In pre- or perimenopausal women, or in men, the aromatase inhibitor should be combined with a luteinising hormone-releasing hormone (LHRH) agonist.

Advanced or metastatic breast cancer

Kisqali is indicated in combination with:

- a non-steroid aromatase inhibitor for the treatment of pre/perimenopausal or postmenopausal women, with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer, as initial endocrine-based therapy; or
- fulvestrant for the treatment of men and postmenopausal women with HR-positive, HER2-negative advanced or metastatic breast cancer, as initial endocrine-based therapy or following disease progression on endocrine therapy.

In pre- or perimenopausal women, the endocrine therapy should be combined with a LHRH agonist.

4.2 Posology and method of administration

Treatment with Kisqali should be initiated by a physician experienced in the use of anticancer therapies.

HR-positive, HER2-negative testing

Patient selection for treatment with Kisqali based on the tumour expression of HR and HER2 should be assessed. Validated test should be used.

Posology

Early breast cancer
The recommended dose is 400 mg (two 200 mg film-coated tablets) of ribociclib once daily for 21 consecutive days followed by 7 days off treatment, resulting in a complete cycle of 28 days. In patients with early breast cancer, Kisqali should be taken until completion of 3 years of treatment or until disease recurrence or unacceptable toxicity occur.

When Kisqali is used in combination with an aromatase inhibitor (AI), the AI should be taken orally once daily continuously throughout the 28-day cycle. Please refer to the Prescribing Information of the AI for additional details.

In pre- or perimenopausal women, or in men, the aromatase inhibitor should be combined with a LHRH agonist.

Kisqali was evaluated in pre-/postmenopausal women, and of men, with HR-positive, HER2-negative, early breast cancer with anatomic stage II or III irrespective of nodal status at high risk of recurrence that was:
• Anatomic stage group IIB-III, or
• Anatomic stage group IIA that is either:
  o Node positive or
  o Node negative, with:
    - Histologic grade 3, or
    - Histologic grade 2, with any of the following criteria:
      - Ki67≥20%
      - High risk by gene signature testing

Advanced or metastatic breast cancer

The recommended dose is 600 mg (three 200 mg film-coated tablets) of ribociclib once daily for 21 consecutive days followed by 7 days off treatment, resulting in a complete cycle of 28 days. In patients with advanced or metastatic breast cancer, t~~T~~he treatment should be continued as long as the patient is deriving clinical benefit from therapy or until unacceptable toxicity occurs.

~~Kisqali should be used together with 2.5 mg letrozole or another non-steroidal aromatase inhibitor or with 500 mg fulvestrant.~~

When Kisqali is used in combination with a non-steroidal ~~aromatase inhibitor~~AI, the non steroidal ~~aromatase inhibitor~~AI should be taken orally once daily continuously throughout the 28-day cycle. Please refer to the Prescribing information of the non-steroidal ~~aromatase inhibitor~~AI for additional details.

When Kisqali is used in combination with fulvestrant, fulvestrant is administered intramuscularly on days 1, 15 and 29, and once monthly thereafter. Please refer to the Prescribing information of fulvestrant for additional details.

Treatment of pre- and perimenopausal women with the approved Kisqali combinations should also include an LHRH agonist in accordance with local clinical practice.

~~Kisqali can be taken with or without food (see section 4.5). Patients should be encouraged to take their dose at approximately the same time each day, preferably in the morning. If the patient vomits after taking the dose or misses a dose, an additional dose should not be taken that day. The next prescribed dose should be taken at the usual time.~~

Dose modifications
Management of severe or intolerable adverse reactions (ARs) may require temporary dose interruption, reduction or discontinuation of Kisqali. If dose reduction is required, the recommended dose reduction guidelines are listed in Table 1.

Table 1 Recommended dose modification guidelines

	Kisqali	
	Dose	Number of 200 mg tablets
Early breast cancer		
Starting dose	400 mg/day	2
Dose reduction	200 mg*/day	1
Advanced or metastatic breast cancer		
Starting dose	600 mg/day	3
First dose reduction	400 mg/day	2
Second dose reduction	200 mg*/day	1
* If further dose reduction below 200 mg/day is required, the treatment should be permanently discontinued.		

Tables 2, 3, 4, 5 and 6 summarise recommendations for dose interruption, reduction or discontinuation of Kisqali in the management of specific ARs. The clinical judgement of the treating physician should guide the management plan of each patient based on individual benefit/risk assessment (see section 4.4).

Complete blood counts (CBC) should be performed before initiating treatment with Kisqali. After initiating treatment CBC should be monitored every 2 weeks for the first 2 cycles, at the beginning of each of the subsequent 4 cycles, then as clinically indicated.

Table 2 Dose modification and management – Neutropenia

	Grade 1 or 2* (ANC 1000/mm^3 - ≤LLN)	**Grade 3*** (ANC 500 - <1000/mm^3)	**Grade 3* febrile neutropenia****	**Grade 4*** (ANC <500/mm^3)
Neutropenia	No dose adjustment is required	Dose interruption until recovery to grade ≤2. Resume Kisqali at the same dose level. If toxicity recurs at grade 3: dose interruption until recovery to grade ≤2, then resume Kisqali and reduce by 1 dose level.	Dose interruption until recovery to grade ≤2. Resume Kisqali and reduce by 1 dose level.	Dose interruption until recovery to grade ≤2. Resume Kisqali and reduce by 1 dose level.
* Grading according to CTCAE Version 4.03 (CTCAE = Common Terminology Criteria for Adverse Events) ** Grade 3 neutropenia with a single fever >38.3°C (or ~~above~~ 38°C and above for more than one hour and/or concurrent infection) ANC = absolute neutrophil count; LLN = lower limit of normal				

Liver function tests (LFTs) should be performed before initiating treatment with Kisqali. After initiating treatment LFTs should be performed every 2 weeks for the first 2 cycles, at the beginning of each of the subsequent 4 cycles, then as clinically indicated. If grade ≥2 abnormalities are noted, more frequent monitoring is recommended.

Table 3 Dose modification and management – Hepatobiliary toxicity

	Grade 1* **(> ULN – 3 x ULN)**	**Grade 2*** **(>3 to 5 x ULN)**	**Grade 3*** **(>5 to 20 x ULN)**	**Grade 4*** **(>20 x ULN)**
AST and/or ALT elevations from baseline, without increase in total bilirubin above 2 x ULN**	No dose adjustment is required.	Baseline grade <2: Dose interruption until recovery to ≤ baseline grade, then resume Kisqali at same dose level. If grade 2 recurs, resume Kisqali at next lower dose level. Baseline grade = 2: No dose interruption.	Dose interruption of Kisqali until recovery to ≤ baseline grade, then resume at next lower dose level. If grade 3 recurs, discontinue Kisqali.	Discontinue Kisqali.
Combined elevations in AST and/or ALT together with total bilirubin increase, in the absence of cholestasis	If patients develop ALT and/or AST >3 x ULN along with total bilirubin >2 x ULN irrespective of baseline grade, discontinue Kisqali.			
* Grading according to CTCAE Version 4.03 (CTCAE = Common Terminology Criteria for Adverse Events) ** Baseline = prior to treatment initiation ULN = upper limit of normal				

ECG should be assessed before initiating treatment with Kisqali in all patients.

Treatment with Kisqali should be initiated only in patients with QTcF values less than 450 msec. After initiating treatment, ECG should be repeated at approximately day 14 of the first cycle, then as clinically indicated.

In case of QTcF prolongation during treatment, more frequent ECG monitoring is recommended in patients with early breast cancer and advanced or metastatic breast cancer.

Table 4 Dose modification and management – QT prolongation

QTcF* prolongation	**Early breast cancer**	**Advanced or metastatic breast cancer**
>480 msec and ≤500 msec	Dose interruption of Kisqali until QTcF resolves to <481 msec.	
	Resume at the same dose level.	Reduce to the next lower dose level.
	If QTcF ≥481 msec recurs, interrupt Kisqali treatment until QTcF resolves to <481 msec, then resume at next lower dose level.	
>500 msec	Dose interruption of Kisqali until QTcF resolves to <481 msec, then resume at next lower dose level. If QTcF >500 msec recurs, discontinue Kisqali.	
If QTcF interval is greater than 500 msec or shows a greater than 60 msec change from baseline in combination with torsade de pointes or polymorphic ventricular tachycardia or signs/symptoms of serious arrhythmia, permanently discontinue Kisqali.		
Note: If further dose reductions are required at the 200 mg dose, Kisqali should be discontinued. *QTcF = QT interval corrected by Fridericia's formula.		

~~**ECGs with QTcF >480 msec**~~	~~1. The dose should be interrupted.~~ ~~2. If QTcF prolongation resolves to <481 msec, resume treatment at the next lower dose level.~~ ~~If QTcF ≥481 msec recurs, interrupt dose until QTcF resolves to <481 msec and then resume Kisqali at the next lower dose level.~~
~~**ECGs with QTcF >500 msec**~~	~~If QTcF is greater than 500 msec, interrupt Kisqali until QTcF is <481 msec then resume Kisqali at next lower dose level.~~ ~~If QTcF interval prolongation to greater than 500 msec or greater than 60 msec change from baseline occurs in combination with torsade de pointes or polymorphic ventricular tachycardia or signs/symptoms of serious arrhythmia, permanently discontinue Kisqali.~~

Table 5 Dose modification and management – ILD/pneumonitis

	Grade 1* (asymptomatic)	**Grade 2*** (symptomatic)	**Grade 3 or 4*** (severe)
ILD/pneumonitis	No dose adjustment is required. Initiate appropriate medical therapy and monitor as clinically indicated.	Dose interruption until recovery to grade ≤1, then resume Kisqali at the next lower dose level**.	Discontinue Kisqali
*Grading according to CTCAE Version 4.03 (CTCAE = Common Terminology Criteria for Adverse Events) **An individualised benefit-risk assessment should be performed when considering resuming Kisqali. ILD = interstitial lung disease			

Table 6 **Dose modification and management – Other toxicities***

Other toxicities	**Grade 1 or 2****	**Grade 3****	**Grade 4****
	No dose adjustment is required. Initiate appropriate medical therapy and monitor as clinically indicated.	Dose interruption until recovery to grade ≤1, then resume Kisqali at the same dose level. If grade 3 recurs, resume Kisqali at the next lower dose level.	Discontinue Kisqali.
* Excluding neutropenia, hepatotoxicity, QT interval prolongation and ILD/pneumonitis. ** Grading according to CTCAE Version 4.03 (CTCAE = Common Terminology Criteria for Adverse Events)			

Refer to the Prescribing information for the co-administered non-steroidal ~~aromatase inhibitor~~AI, fulvestrant or LHRH agonist for dose modification guidelines and other relevant safety information in the event of toxicity.

Dose modification for use of Kisqali with strong CYP3A4 inhibitors

Concomitant use of strong CYP3A4 inhibitors should be avoided and an alternative concomitant medicinal product with less potential to inhibit CYP3A4 inhibition should be considered. If patients must be given a strong CYP3A4 inhibitor concomitantly with ribociclib, the Kisqali dose should be reduced ~~to 400 mg once daily~~ (see section 4.5).

In patients taking 600 mg ribociclib daily and in whom initiation of co-administration of a strong CYP3A4 inhibitor cannot be avoided, the dose should be reduced to 400 mg.

In patients ~~who have had their dose reduced to~~ taking 400 mg ribociclib daily and in whom initiation

of co-administration of a strong CYP3A4 inhibitor cannot be avoided, the dose should be further reduced to 200 mg.

In patients who have had their dose reduced to 200 mg ribociclib daily and in whom initiation of co-administration of a strong CYP3A4 inhibitor cannot be avoided, Kisqali treatment should be interrupted.

Due to inter-patient variability, the recommended dose adjustments may not be optimal in all patients, therefore close monitoring of signs of toxicity is recommended. If the strong inhibitor is discontinued, the Kisqali dose should be changed to the dose used prior to the initiation of the strong CYP3A4 inhibitor after at least 5 half-lives of the strong CYP3A4 inhibitor (see sections 4.4, 4.5 and 5.2).

Special populations
Renal impairment
No dose adjustment is necessary in patients with mild or moderate renal impairment. A starting dose of 200 mg is recommended in patients with severe renal impairment. Kisqali has not been studied in breast cancer patients with severe renal impairment (see sections 4.4, 5.1 and 5.2).
Caution should be used in patients with severe renal impairment, ESRD (End Stage Renal Disease) or on dialysis treatment with close monitoring for signs of toxicity as there is no experience with Kisqali in this patient population.

Hepatic impairment
No dose adjustment is necessary in patients with early breast cancer with hepatic impairment (see section 5.2). In patients with advanced or metastatic breast cancer, no dose adjustment is necessary in patients with mild hepatic impairment (Child-Pugh class A)~~.~~ ~~P~~patients with moderate (Child-Pugh class B) and severe hepatic impairment (Child-Pugh class C) can have increased (less than 2-fold) exposure to ribociclib and the starting dose of 400 mg Kisqali once daily is recommended (see section 5.2).

Paediatric population
Kisqali is not indicated for use in children and adolescents**.**

Elderly
No dose adjustment is required in patients over 65 years of age (see section 5.2).

Method of administration

Kisqali should be taken orally once daily with or without food (see section 4.5). Patients should be encouraged to take their dose at approximately the same time each day, preferably in the morning. If the patient vomits after taking the dose or misses a dose, an additional dose should not be taken that day. The next prescribed dose should be taken at the usual time. The tablets should be swallowed whole and should not be chewed, crushed or split prior to swallowing (No information about crushing/ splitting/ chewing is available). No tablet should be ingested if it is broken, cracked or otherwise not intact~~.~~.

4.3 Contraindications

Hypersensitivity to the active substance or to peanut, soya or any of the excipients listed in section 6.1.

4.4 Special warnings and precautions for use

Critical visceral disease

The efficacy and safety of ribociclib have not been studied in patients with critical visceral disease.

Neutropenia

Based on the severity of the neutropenia, treatment with Kisqali may have to be interrupted, reduced or discontinued as described in Table 2 (see sections 4.2 and 4.8).

Hepatobiliary toxicity

Liver function tests should be performed before initiating treatment with Kisqali. After initiating treatment, liver function should be monitored (see sections 4.2 and 4.8).

Based on the severity of the transaminase elevations, treatment with Kisqali may have to be interrupted, reduced or discontinued as described in Table 3 (see sections 4.2 and 4.8). Recommendations for patients who have elevated AST/ALT grade ≥ 3 at baseline have not been established.

QT interval prolongation

The use of Kisqali should be avoided in patients who already have or who are at significant risk of developing QTc prolongation. This includes patients:

- with long QT syndrome;
- with uncontrolled or significant cardiac disease, including recent myocardial infarction, congestive heart failure, unstable angina and bradyarrhythmias;
- with electrolyte abnormalities.

The use of Kisqali with medicinal products known to prolong QTc interval and/or strong CYP3A4 inhibitors should be avoided as this may lead to clinically meaningful prolongation of the QTcF interval (see sections 4.2, 4.5 and 5.1). If co-administration of Kisqali with a strong CYP3A4 inhibitor cannot be avoided, the Kisqali dose should be changed as described in section 4.2.

Based on the findings from study E2301 (MONALEESA-7), Kisqali is not recommended for use in combination with tamoxifen (see sections 4.8 and 5.1).

Early breast cancer
In study O12301C (NATALEE), a QTcF interval increase >60 msec from baseline was observed in 19 (0.8%) patients receiving Kisqali plus AI.

ECG should be assessed before initiating treatment. Treatment with Kisqali should be initiated only in patients with QTcF values less than 450 msec. ECG should be repeated at approximately day 14 of the first cycle, then as clinically indicated (see sections 4.2 and 4.8).

In patients with early breast cancer, appropriate monitoring of serum electrolytes (including potassium, calcium, phosphorus and magnesium) should be performed before initiating treatment, at the beginning of the first 6 cycles and then as clinically indicated. Any abnormality should be corrected before initiating treatment with Kisqali and during treatment with Kisqali.

Based on the observed QT prolongation during treatment, treatment with Kisqali may have to be interrupted, reduced or discontinued as described in Table 4 (see sections 4.2, 4.8 and 5.2).

Advanced or metastatic breast cancer

In study E2301 (MONALEESA-7), a QTcF interval increase >60 msec from baseline was observed in 14/87 (16.1%) patients receiving Kisqali plus tamoxifen and in 18/245 (7.3%) patients receiving Kisqali plus a non-steroidal aromatase inhibitor (NSAI). ~~Kisqali is not recommended to be used in combination with tamoxifen (see sections 4.8 and 5.1).~~

ECG should be assessed before initiating treatment. Treatment with Kisqali should be initiated only in patients with QTcF values less than 450 msec. ECG should be repeated at approximately day 14 of the first cycle-, then as clinically indicated (see sections 4.2 and 4.8).

In patients with advanced or metastatic breast cancer, a~~A~~ppropriate monitoring of serum electrolytes (including potassium, calcium, phosphorus and magnesium) should be performed before initiating treatment, at the beginning of the first 6 cycles and then as clinically indicated. Any abnormality should be corrected before initiating treatment with Kisqali and during treatment with Kisqali.

~~The use of Kisqali should be avoided in patients who already have or who are at significant risk of developing QTc prolongation. This includes patients:~~

- ~~with long QT syndrome;~~
- ~~with uncontrolled or significant cardiac disease, including recent myocardial infarction, congestive heart failure, unstable angina and bradyarrhythmias;~~
- ~~with electrolyte abnormalities.~~

~~The use of Kisqali with medicinal products known to prolong QTc interval and/or strong CYP3A4 inhibitors should be avoided as this may lead to clinically meaningful prolongation of the QTcF interval (see sections 4.2, 4.5 and 5.1). If treatment with a strong CYP3A4 inhibitor cannot be avoided, the dose should be reduced to 400 mg once daily (see sections 4.2 and 4.5).~~

Based on the observed QT prolongation during treatment, treatment with Kisqali may have to be interrupted, reduced or discontinued as described in Table 4 (see sections 4.2, 4.8 and 5.2).

Thromboembolic events

Caution is advised in patients with risk factors for thromboembolic events while receiving the combination of Kisqali with endocrine treatment.
Monitor patients for signs and symptoms of thromboembolism and treat as medically appropriate.

Severe cutaneous reactions

Toxic epidermal necrolysis (TEN) has been reported with Kisqali treatment. If signs and symptoms suggestive of severe cutaneous reactions (e.g. progressive widespread skin rash often with blisters or mucosal lesions) appear, Kisqali should be discontinued immediately.

Interstitial lung disease/pneumonitis

Interstitial lung disease (ILD)/pneumonitis has been reported with Kisqali. Patients should be monitored for pulmonary symptoms indicative of ILD/pneumonitis which may include hypoxia, cough and dyspnoea and dose modifications should be managed in accordance with Table 5 (see section 4.2). Based on the severity of the ILD/pneumonitis, which may be fatal, Kisqali may require dose interruption, reduction or discontinuation as described in Table 5 (see section 4.2).

Blood creatinine increase

Ribociclib may cause blood creatinine increase as an inhibitor of the renal transporters organic cation transporter 2 (OCT2) and multidrug and toxin extrusion protein 1 (MATE1), which are involved in the active secretion of creatinine from the proximal tubules (see section 4.5). In case of blood creatinine increase while on treatment, it is recommended that further assessment of the renal function be performed to exclude renal impairment.

CYP3A4 substrates

Ribociclib is a strong CYP3A4 inhibitor at the 600 mg dose and a moderate CYP3A4 inhibitor at the 400 mg dose. Thus, ribociclib may interact with medicinal products which are metabolised via CYP3A4, which may lead to increased serum concentrations of CYP3A4 substrates (see section 4.5). Caution is recommended in case of concomitant use with sensitive CYP3A4 substrates with a narrow therapeutic index and the Prescribing information of the other product should be consulted for the recommendations regarding co-administration with CYP3A4 inhibitors.

Renal impairment

The recommended starting dose of 200 mg for patients with severe renal impairment is estimated to result in approximately 45% lower exposure compared with the standard starting dose of 600 mg in advanced or metastatic breast cancer patients with normal renal function. The efficacy at this starting dose has not been studied. Caution should be used in patients with severe renal impairment with close monitoring for signs of toxicity (see sections 4.2 and 5.2).

Women of childbearing potential

Women of childbearing potential should be advised to use an effective method of contraception while taking Kisqali and for at least 21 days after the last dose (see section 4.6).

Soya lecithin

Kisqali contains soya lecithin. Patients who are hypersensitive to peanut or soya should not take Kisqali (see section 4.3).

4.5 Interaction with other medicinal products and other forms of interaction

Substances that may increase ribociclib plasma concentrations

Ribociclib is primarily metabolised by CYP3A4. Therefore, medicinal products that can influence CYP3A4 enzyme activity may alter the pharmacokinetics of ribociclib. Co-administration of the strong CYP3A4 inhibitor ritonavir (100 mg twice daily for 14 days) with a single 400 mg dose of ribociclib increased ribociclib exposure (AUC_{inf}) and the peak concentration (C_{max}) in healthy subjects 3.2 and 1.7-fold, respectively, relative to a single 400 mg ribociclib dose given alone. C_{max} and AUC_{last} for LEQ803 (a prominent metabolite of ribociclib accounting for less than 10% of parent exposure) decreased by 96% and 98%, respectively. Physiologically-based pharmacokinetic (PBPK) simulations with co-administered ~~estimated that co-administration of~~ ritonavir (100 mg twice daily) estimated that the ~~with multiple daily doses of ribociclib may increase ribociclib~~ steady-state C_{max} and AUC_{0-24h} of ribociclib (400 mg once daily) increased by 1.5- and 1.8-fold, respectively.

The concomitant use of strong CYP3A4 inhibitors including, but not limited to, the following must be avoided: clarithromycin, indinavir, itraconazole, ketoconazole, lopinavir, ritonavir, nefazodone, nelfinavir, posaconazole, saquinavir, telaprevir, telithromycin, verapamil and voriconazole (see section 4.4). Alternative concomitant medicinal products with less potential to inhibit CYP3A4 should be considered and patients should be monitored for ribociclib-related ARs (see sections 4.2, 4.4 and 5.2).

If co-administration of Kisqali with a strong CYP3A4 inhibitor cannot be avoided, the dose of Kisqali should be changed~~reduced~~ as described in section 4.2. However, there are no clinical data with these dose adjustments. Due to inter-patient variability, the recommended dose adjustments may not be optimal in all patients, therefore close monitoring for ribociclib-related ARs is recommended. In the event of ribociclib-related toxicity, the dose should be modified or treatment should be interrupted until toxicity is resolved (see sections 4.2 and 5.2). If the strong CYP3A4 inhibitor is discontinued, and after at least 5 half-lives of the CYP3A4 inhibitor (refer to the Prescribing information of the CYP3A4 inhibitor in question), Kisqali should be resumed at the same dose used prior to the initiation

of the strong CYP3A4 inhibitor.

~~Physiologically-based pharmacokinetic~~ PBPK simulations suggested that ~~for~~ at a 600 mg dose of ribociclib, a moderate CYP3A4 inhibitor (erythromycin) may increase ribociclib steady-state C_{max} and AUC 1.1~~-fold~~ and 1.1-fold, respectively. PBPK simulations suggested that a moderate CYP3A4 inhibitor may increase C_{max} and AUC of ribociclib 400 mg steady state by 1.1- and 1.2-fold, respectively. ~~For patients who had their ribociclib dose reduced to 400 mg once daily, the increase of the steady-state C_{max} and AUC was estimated to be 1.1- and 1.2-fold, respectively.~~ The effect at the 200 mg once-daily dose was predicted to be a 1.3- and 1.5-fold increase in steady-state C_{max} and AUC, respectively. No dose adjustments of ribociclib are required at initiation of treatment with mild or moderate CYP3A4 inhibitors. However, monitoring of ribociclib-related ARs is recommended.

Patients should be instructed to avoid grapefruit or grapefruit juice. These are known to inhibit cytochrome CYP3A4 enzymes and may increase the exposure to ribociclib.

Substances that may decrease ribociclib plasma concentrations

Co-administration of the strong CYP3A4 inducer rifampicin (600 mg daily for 14 days) with a single 600 mg dose of ribociclib decreased the ribociclib AUC_{inf} and C_{max} by 89% and 81%, respectively, relative to a single 600 mg ribociclib dose given alone in healthy subjects. LEQ803 C_{max} increased 1.7-fold and AUC_{inf} decreased by 27%, respectively. The concomitant use of strong CYP3A4 inducers may therefore lead to decreased exposure and consequently a risk for lack of efficacy. The concomitant use of strong CYP3A4 inducers should be avoided, including, but not limited to, phenytoin, rifampicin, carbamazepine and St John's Wort *(Hypericum perforatum)*. An alternative concomitant medicinal product with no or minimal potential to induce CYP3A4 should be considered.

The effect of a moderate CYP3A4 inducer on ribociclib exposure has not been studied. PBPK~~Physiologically-based pharmacokinetic~~ simulations suggested that a moderate CYP3A4 inducer (efavirenz) may decrease steady-state ribociclib C_{max} and AUC by ~~51~~55% and ~~70~~74%, respectively, at a ribociclib dose of 400 mg, and by 52~~51~~% and 71~~70~~%, respectively, at a ribociclib dose of 600 mg. The concomitant use of moderate CYP3A4 inducers may therefore lead to decreased exposure and consequently a risk for impaired efficacy, in particular in patients treated with ribociclib at 400 mg or 200 mg once daily.

Substances that may have plasma concentrations altered by Kisqali

Ribociclib is a moderate to strong CYP3A4 inhibitor and may interact with medicinal substrates that are metabolised via CYP3A4, which can lead to increased serum concentrations of the concomitantly used medicinal product.

Co-administration of midazolam (CYP3A4 substrate) with multiple doses of Kisqali (400 mg) increased the midazolam exposure by 280% (3.80-fold) in healthy subjects, compared with administration of midazolam alone. PBPK s~~S~~imulations ~~using physiologically-based pharmacokinetic models~~ suggested that Kisqali given at the ~~clinically relevant~~ dose of 600 mg is expected to increase the midazolam AUC by 5.2-fold. Therefore, in general, when ribociclib is co-administered with other medicinal products, the Prescribing Information of the other medicinal product must be consulted for the recommendations regarding co-administration with CYP3A4 inhibitors. Caution is recommended in case of concomitant use with sensitive CYP3A4 substrates with a narrow therapeutic index (see section 4.4). The dose of a sensitive CYP3A4 substrate with a narrow therapeutic index, including but not limited to alfentanil, ciclosporin, everolimus, fentanyl, sirolimus and tacrolimus, may need to be reduced as ribociclib can increase their exposure.

Concomitant administration of ribociclib ~~at the 600 mg dose~~ with the following CYP3A4 substrates should be avoided: alfuzosin, amiodarone, cisapride, pimozide, quinidine, ergotamine, dihydroergotamine, quetiapine, lovastatin, simvastatin, sildenafil, midazolam, triazolam.

Co-administration of caffeine (CYP1A2 substrate) with multiple doses of Kisqali (400 mg) increased

the caffeine exposure by 20% (1.20-fold) in healthy subjects, compared with administration of caffeine alone. At the clinically relevant dose of 600 mg, simulations using PBPK models predicted only weak inhibitory effects of ribociclib on CYP1A2 substrates (<2-fold increase in AUC).

Substances that are substrates of transporters

In vitro evaluations indicated that ribociclib has a potential to inhibit the activities of drug transporters P-gp, BCRP, OATP1B1/1B3, OCT1, OCT2, MATE1 and BSEP. Caution and monitoring for toxicity are advised during concomitant treatment with sensitive substrates of these transporters which exhibit a narrow therapeutic index, including but not limited to digoxin, pitavastatin, pravastatin, rosuvastatin and metformin.

Drug-food interactions

Kisqali can be administered with or without food (see sections 4.2 and 5.2).

Medicinal products that elevate gastric pH

Ribociclib exhibits high solubility at or below pH 4.5 and in bio-relevant media (at pH 5.0 and 6.5). Co-administration of ribociclib with medicinal products that elevate the gastric pH was not evaluated in a clinical study; however, altered ribociclib absorption was not observed in population pharmacokinetic and non–compartmental pharmacokinetic analyses.

Drug-drug interaction between ribociclib and letrozole

Data from a clinical study in patients with breast cancer and population pharmacokinetic analysis indicated no drug interaction between ribociclib and letrozole following co-administration of these medicinal products.

Drug-drug interaction between ribociclib and anastrozole

Data from a clinical study in patients with breast cancer indicated no clinically relevant drug interaction between ribociclib and anastrozole following co-administration of these medicinal products.

Drug-drug interaction between ribociclib and fulvestrant

Data from a clinical study in patients with breast cancer indicated no clinically relevant effects of fulvestrant on ribociclib exposure following co-administration of these medicinal products.

Drug-drug interaction between ribociclib and tamoxifen

Data from a clinical study in patients with breast cancer indicated that tamoxifen exposure was increased approximately 2-fold following co-administration of ribociclib and tamoxifen.

Drug-drug interactions between ribociclib and oral contraceptives

Drug-drug interaction studies between ribociclib and oral contraceptives have not been conducted (see section 4.6).

Anticipated interactions

Anti-arrhythmic medicinal products and other medicinal products that may prolong the QT interval
Co-administration of Kisqali with medicinal products with a known potential to prolong the QT interval such as anti-arrhythmic medicinal products (including, but not limited to, amiodarone, disopyramide, procainamide, quinidine and sotalol), and other medicinal products that are known to prolong the QT interval (including, but not limited to, chloroquine, halofantrine, clarithromycin,

ciprofloxacin, levofloxacin, azithromycin, haloperidol, methadone, moxifloxacin, bepridil, pimozide and intravenous ondansetron) should be avoided (see section 4.4). Kisqali is also not recommended to be used in combination with tamoxifen (see sections 4.1, 4.4 and 5.1).

4.6 Fertility, pregnancy and lactation

Women of childbearing potential/Contraception

Pregnancy status should be verified prior to starting treatment with Kisqali.

Women of childbearing potential who are receiving Kisqali should use effective contraception (e.g. double-barrier contraception) during therapy and for at least 21 days after the last dose.

Pregnancy

There are no adequate and well-controlled studies in pregnant women. Based on findings in animals, ribociclib can cause foetal harm when administered to a pregnant woman (see section 5.3). Kisqali is not recommended during pregnancy and in women of childbearing potential not using contraception.

Breast-feeding

It is not known if ribociclib is present in human milk. There are no data on the effects of ribociclib on the breast-fed infant or the effects of ribociclib on milk production. Ribociclib and its metabolites readily passed into the milk of lactating rats. Patients receiving Kisqali should not breast-feed for at least 21 days after the last dose.

Fertility

There are no clinical data available regarding effects of ribociclib on fertility. Based on animal studies, ribociclib may impair fertility in males of reproductive potential (see section 5.3).

4.7 Effects on ability to drive and use machines

Kisqali may have minor influence on the ability to drive and use machines. Patients should be advised to be cautious when driving or using machines in case they experience fatigue, dizziness or vertigo during treatment with Kisqali (see section 4.8).

4.8 Undesirable effects

Summary of the safety profile

Early breast cancer
The most common adverse drug reactions (ADRs) (reported at a frequency ≥20%) in the dataset for which the frequency for Kisqali plus aromatase inhibitor (AI) exceeds the frequency for AI alone were neutropenia, infections, nausea, headache, fatigue, leukopenia and abnormal liver function tests.

The most common grade 3/4 ADRs (reported at a frequency of ≥2%) in the dataset for which the frequency for Kisqali plus AI exceeds the frequency for AI alone were neutropenia, abnormal liver function tests and leukopenia.

Dose reduction due to adverse events, regardless of causality, occurred in 22.8% of patients receiving Kisqali plus AI in the phase III clinical study. Permanent discontinuation was reported in 19.7% of patients receiving Kisqali plus AI in the phase III clinical study.

Advanced or metastatic breast cancer

The most common adverse drug reactions (ADRs) (reported at a frequency ≥20%) in the pooled dataset for which the frequency for Kisqali plus any combination exceeds the frequency for placebo plus any combination were neutropenia, infections, nausea, fatigue, diarrhoea, leukopenia, vomiting, headache, constipation, alopecia, cough, rash, back pain, anaemia and abnormal liver function tests.

The most common grade 3/4 ADRs (reported at a frequency of ≥2%) in the pooled dataset for which the frequency for Kisqali plus any combination exceeds the frequency for placebo plus any combination were neutropenia, leukopenia, abnormal liver function tests, lymphopenia, infections, back pain, anaemia, fatigue, hypophosphataemia and vomiting.

Dose reduction due to adverse events, regardless of causality, occurred in 39.5% of patients receiving Kisqali in the phase III clinical studies regardless of the combination. Pand permanent discontinuation was reported in 8.7% of patients receiving Kisqali and any combination in the phase III clinical studies.

Tabulated list of adverse reactions

Early breast cancer
The overall safety evaluation of Kisqali is based on the dataset from 2 525 patients who received Kisqali in combination with AI and who were included in the randomised, open-label phase III clinical study NATALEE.

The median duration of exposure to ribociclib across the study was 33.0 months, with 69.4% patients exposed for >24 months, and 42.8% patients completing the 36-month ribociclib regimen.

Advanced or metastatic breast cancer

The overall safety evaluation of Kisqali is based on the pooled dataset from 1,065 patients who received Kisqali in combination with endocrine therapy (N=582 in combination with a non-steroidal aromatase inhibitor and N=483 in combination with fulvestrant) and who were included in the randomised, double-blind, placebo-controlled phase III clinical studies (MONALEESA-2, MONALEESA-7 NSAI subgroup and MONALEESA-3) in HR-positive, HER2-negative advanced or metastatic breast cancer.
Additional ADRs were identified post-marketing.

The median duration of exposure to study treatment across the pooled phase III studies dataset was 19.2 months, with 61.7% patients exposed ≥12 months.

ADRsAdverse reactions from the phase III clinical studies and post-marketing experience (Table 7) in patients with early breast cancer and advanced or metastatic breast cancer are listed by MedDRA system organ class. Within each system organ class, the adverse reactions are ranked by frequency, with the most frequent reactions first. Within each frequency grouping, adverse reactions are presented in order of decreasing seriousness. In addition, the corresponding frequency category for each adverse reaction is based on the following convention (CIOMS III): very common (≥1/10); common (≥1/100 to <1/10); uncommon (≥1/1,000 to <1/100); rare (≥1/10,000 to <1/1,000); very rare (<1/10,000); and not known (cannot be estimated from the available data).

Table 7 Adverse drug reactions reported in the three phase III clinical studies and

during post-marketing experience

Frequency	Patients with early breast cancer with starting dose 400 mg ribociclib	Patients with advanced or metastatic breast cancer with starting dose 600 mg ribociclib
Infections and infestations		
Very common	Infections[1]	Infections[1]
Blood and lymphatic system disorders		
Very common	Neutropenia, leukopenia	Neutropenia, leukopenia, anaemia, lymphopenia
Common	Anaemia, thrombocytopenia, lymphopenia	Thrombocytopenia, febrile neutropenia
Uncommon	Febrile neutropenia	-
Metabolism and nutrition disorders		
Very common	-	Appetite decreased
Common	Hypocalcaemia, hypokalaemia, appetite decreased	Hypocalcaemia, hypokalaemia, hypophosphataemia
Nervous system disorders		
Very common	Headache	Headache, dizziness
Common	Dizziness	Vertigo
Eye disorders		
Common	-	Lacrimation increased, dry eye
Cardiac disorders		
Common	-	Syncope
Respiratory, thoracic and mediastinal disorders		
Very common	Cough	Dyspnoea, cough
Common	Dyspnoea, interstitial lung disease (ILD) / pneumonitis	Interstitial lung disease (ILD) / pneumonitis
Gastrointestinal disorders		
Very common	Nausea, diarrhoea, constipation, abdominal pain[2]	Nausea, diarrhoea, vomiting, constipation, abdominal pain[2], stomatitis, dyspepsia
Common	Vomiting, stomatitis[3]	Dysgeusia
Hepatobiliary disorders		
Common	Hepatotoxicity[4]	Hepatotoxicity[4]
Skin and subcutaneous tissue disorders		
Very common	Alopecia	Alopecia, rash[5], pruritus
Common	Rash[5], pruritus	Dry skin, erythema, vitiligo
Rare	-	Erythema multiforme
Not known	-	Toxic epidermal necrolysis (TEN)
Musculoskeletal and connective tissue disorders		
Very common	-	Back pain
General disorders and administration site conditions		
Very common	Fatigue, asthenia, pyrexia	Fatigue, peripheral oedema, pyrexia, asthenia
Common	Peripheral oedema, oropharyngeal pain	Oropharyngeal pain, dry mouth

Investigations		
Very common	Abnormal liver function tests[6]	Abnormal liver function tests[6]
Common	Blood creatinine increased, electrocardiogram QT prolonged	Blood creatinine increased, electrocardiogram QT prolonged

[1] Infections: urinary tract infections, respiratory tract infections, gastroenteritis (only in patients with advanced or metastatic breast cancer), sepsis (<1% only in patients with advanced or metastatic breast cancer).
[2] Abdominal pain: abdominal pain, abdominal pain upper.
[3] Stomatitis for early breast cancer includes: stomatitis, mucositis.
[4] Hepatotoxicity: hepatic cytolysis, hepatocellular injury (only in patients with advanced or metastatic breast cancer), drug-induced liver injury (<1% in patients with early breast cancer and in patients with advanced or metastatic breast cancer), hepatotoxicity, hepatic failure (only in patients with advanced or metastatic breast cancer), autoimmune hepatitis.
[5] Rash: rash, rash maculopapular, rash pruritic.
[6] Abnormal liver function tests: ALT increased, AST increased, blood bilirubin increased.

Description of selected adverse reactions

Neutropenia

In the phase III study in patients with early breast cancer, neutropenia was the most frequently reported adverse reaction (62.5%) and a grade 3 or 4 decrease in neutrophil counts (based on laboratory findings) was reported in 45.1% of patients receiving Kisqali plus aromatase inhibitor (AI).

Among the patients with early breast cancer who had grade 2, 3 or 4 neutropenia, the median time to onset was 0.6 months, for those patients who had an event. The median time to resolution of grade ≥3 (to normalisation or grade <3) was 0.3 months in the Kisqali plus AI arm following treatment interruption and/or reduction and/or discontinuation. Febrile neutropenia was reported in 0.3% of patients exposed to Kisqali plus AI. Treatment discontinuation due to neutropenia was low (1.1%) in patients receiving Kisqali plus AI (see sections 4.2 and 4.4).

In the phase III studies in patients with advanced or metastatic breast cancer nNeutropenia was the most frequently reported adverse reaction (75.4%) and a grade 3 or 4 decrease in neutrophil counts (based on laboratory findings) was reported in 62.0% of patients receiving Kisqali plus any combination in the phase III studies.

Among the patients with advanced or metastatic breast cancer who had grade 2, 3 or 4 neutropenia, the median time to onset was 17 days, for those patients who had an event. The median time to resolution of grade ≥3 (to normalisation or grade <3) was 12 days in the Kisqali plus any combination arms following treatment interruption and/or reduction and/or discontinuation. Febrile neutropenia was reported in about 1.7% of patients exposed to Kisqali in the phase III studies. Patients should be instructed to report any fever promptly.

Based on its severity, neutropenia was managed by laboratory monitoring, dose interruption and/or dose modification.
Treatment discontinuation due to neutropenia was low (0.8%) (see sections 4.2 and 4.4).

All patients should be instructed to report any fever promptly.

Hepatobiliary toxicity

In the phase III clinical studies in patients with early breast cancer and advanced or metastatic breast cancer, increases in transaminases were observed.

In the phase III study in patients with early breast cancer, hepatobiliary toxicity events occurred in a higher proportion of patients in the Kisqali plus AI arm versus the AI alone arm (26.4% versus 11.2%,

respectively), with more grade 3/4 adverse events reported in patients treated with Kisqali plus AI (8.6% versus 1.7%, respectively). Concurrent elevations of ALT or AST greater than three times the upper limit of normal and total bilirubin greater than two times the upper limit of normal, with normal alkaline phosphatase levels, occurred in 8 patients treated with Kisqali plus AI (in 6 patients ALT or AST levels recovered to normal within 65 to 303 days after discontinuation of Kisqali).

Dose interruptions due to hepatobiliary toxicity events were reported in 12.4% of patients with early breast cancer treated with Kisqali plus AI, primarily due to ALT increased (10.1%) and/or AST increased (6.8%). Dose adjustment due to hepatobiliary toxicity events was reported in 2.6% of patients treated with Kisqali plus AI, primarily due to ALT increased (1.9%) and/or AST increased (0.6%). Discontinuation of treatment with Kisqali due to abnormal liver function tests or hepatotoxicity occurred in 8.9% and 0.1% of patients, respectively (see sections 4.2 and 4.4).

In the phase III clinical study in patients with early breast cancer, 80.9% (165/204) of grade 3 or 4 ALT or AST elevation events occurred within the first 6 months of treatment. Among the patients who had grade 3 or 4 ALT/AST elevation, the median time to onset was 2.8 months for the Kisqali plus AI arm. The median time to resolution (to normalisation or grade ≤2) was 0.7 months in the Kisqali plus AI arm.

In the phase III clinical studies in patients with advanced or metastatic breast cancer, hepatobiliary toxicity events occurred in a higher proportion of patients in the Kisqali plus any combination arms compared with the placebo plus any combination arms (27.3% versus 19.6%, respectively), with more grade 3/4 adverse events reported in the patients treated with Kisqali plus any combination (13.2% versus 6.1%, respectively). ~~Increases in transaminases were observed~~. Grade 3 or 4 increases in ALT (11.2% versus 1.7%) and AST (7.8% versus 2.1%) were reported in the Kisqali and placebo arms, respectively. Concurrent elevations in ALT or AST greater than three times the upper limit of normal and total bilirubin greater than two times the upper limit of normal, with normal alkaline phosphatase, in the absence of cholestasis occurred in 6 patients (4 patients in Study A2301 [MONALEESA-2], whose levels recovered to normal within 154 days and 2 patients in Study F2301 [MONALEESA-3], whose levels recovered to normal in 121 and 532 days, respectively, after discontinuation of Kisqali). There were no such cases reported in Study E2301 (MONALEESA-7).

Dose interruptions and/or adjustments due to hepatobiliary toxicity events were reported in 12.3% of Kisqali plus any combination treated patients with advanced or metastatic breast cancer, primarily due to ALT increased (7.9%) and/or AST increased (7.3%). Discontinuation of treatment with Kisqali plus any combination due to abnormal liver function tests or hepatotoxicity occurred in 2.4% and 0.3% of patients respectively (see sections 4.2 and 4.4).

In the phase III clinical studies in patients with advanced or metastatic breast cancer, 70.9% (90/127) of grade 3 or 4 ALT or AST elevation events occurred within the first 6 months of treatment. Among the patients who had grade 3 or 4 ALT/AST elevation, the median time to onset was 92 days for the Kisqali plus any combination arms. The median time to resolution (to normalisation or grade ≤2) was 21 days in the Kisqali plus any combination arms.

QT prolongation

In the phase III study in patients with early breast cancer, 5.3% of patients in the Kisqali plus AI arm and 1.4% of patients in the AI alone arm reported events of QT interval prolongation. In the Kisqali plus AI arm QT interval prolongation events were presented primarily by ECG QT prolonged (4.3%) which was the only confirmed adverse reaction with Kisqali. Dose interruptions due to ECG QT prolonged and syncope were reported in 1.1% of patients treated with Kisqali. Dose adjustments due to ECG QT prolonged were reported in 0.1% of patients treated with Kisqali.

A central analysis of ECG data showed 10 patients (0.4%) and 4 patients (0.2%) with at least one post-baseline QTcF interval >480 msec for the Kisqali plus AI arm and the AI alone arm, respectively. Among the patients who had QTcF interval prolongation of >480 msec in the Kisqali plus AI arm, the median time to onset was 15 days and these changes were reversible with dose interruption and/or dose adjustment. QTcF interval >60 msec change from baseline was observed in 19 patients (0.8%) in

the Kisqali plus AI arm and post-baseline QTcF interval >500 msec was observed in 3 patients (0.1%) in the Kisqali plus AI arm.

In study E2301 (MONALEESA-7) in patients with advanced or metastatic breast cancer, the observed mean QTcF increase from baseline was approximately 10 msec higher in the tamoxifen plus placebo subgroup compared with the NSAI plus placebo subgroup, suggesting that tamoxifen alone had a QTcF prolongation effect which can contribute to the QTcF values observed in the Kisqali plus tamoxifen group. In the placebo arm, a QTcF interval increase of >60 msec from baseline occurred in 6/90 (6.7%) patients receiving tamoxifen and in no patients receiving a NSAI (see section 5.2). A QTcF interval increase of >60 msec from baseline was observed in 14/87 (16.1%) patients receiving Kisqali plus tamoxifen and in 18/245 (7.3%) patients receiving Kisqali plus a NSAI. Kisqali is not recommended to be used in combination with tamoxifen (see section 5.1).

In the phase III clinical studies 9.3% of patients with advanced or metastatic breast cancer in the Kisqali plus aromatase inhibitor or fulvestrant arms and 3.5% in the placebo plus aromatase inhibitor or fulvestrant arms had at least one event of QT interval prolongation (including ECG QT prolonged and syncope). Review of ECG data showed 15 patients (1.4%) had >500 msec post-baseline QTcF value, and 61 patients (5.8%) had a >60 msec increase from baseline in QTcF intervals. There were no reported cases of torsade de pointes. Dose interruptions/adjustments were reported in 2.9% of Kisqali plus non-steroidal aromatase inhibitor or fulvestrant treated patients due to electrocardiogram QT prolonged and syncope.

The analysis of ECG data showed 55 patients (5.2%) and 12 patients (1.5%) with at least one >480 msec post-baseline QTcF for the Kisqali plus non-steroidal aromatase inhibitor or fulvestrant arms and the placebo plus non-steroidal aromatase inhibitor or fulvestrant arms, respectively. Amongst the patients who had QTcF prolongation >480 msec, the median time to onset was 15 days regardless of the combination and these changes were reversible with dose interruption and/or dose reduction (see sections 4.2, 4.4 and 5.2).

Patients with renal impairment
In the phase III clinical study in patients with early breast cancer, 983 patients with mild renal impairment and 71 patients with moderate renal impairment were treated with ribociclib. No patient with severe renal impairment was enrolled (see section 5.1).

In the three pivotal studies, 341 patients with advanced or metastatic breast cancer with mild renal impairment and 97 patients with moderate renal impairment were treated with ribociclib. No patient with severe renal impairment was enrolled (see section 5.1). There was a correlation between the degree of renal impairment at baseline and blood creatinine values during the treatment. Slightly increased rates of QT prolongation and thrombocytopenia were observed in patients with mild or moderate renal impairment. For monitoring and dose adjustment recommendations for these toxicities see sections 4.2. and 4.4.

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product.
Any suspected adverse events should be reported to the Ministry of Health according to the National Regulation by using an online form
https://sideeffects.health.gov.il/
And to Novartis using the following email address: Safetydesk.israel@novartis.com

4.9 Overdose

There is only limited experience with reported cases of overdose with Kisqali. In the event of an overdose, symptoms such as nausea and vomiting may occur. In addition, haematological (e.g. neutropenia, thrombocytopenia) toxicity and possible QTc prolongation may occur. General

supportive care should be initiated in all cases of overdose as necessary.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Antineoplastic agents, protein kinase inhibitors, ATC code: L01EF02

Mechanism of action

Ribociclib is a selective inhibitor of cyclin-dependent kinase (CDK) 4 and 6, resulting in 50% inhibition (IC_{50}) values of 0.01 (4.3 ng/ml) and 0.039 µM (16.9 ng/ml) in biochemical assays, respectively. These kinases are activated upon binding to D-cyclins and play a crucial role in signalling pathways which lead to cell cycle progression and cellular proliferation. The cyclin D-CDK4/6 complex regulates cell cycle progression through phosphorylation of the retinoblastoma protein (pRb).

In vitro, ribociclib decreased pRb phosphorylation, resulting in ~~leading to~~ arrest in the G1 phase of the cell cycle, ~~and~~ reduced ~~cell~~ proliferation and a senescent phenotype in breast cancer derived models ~~cell lines~~. *In vivo*, treatment with single-agent ribociclib led to tumour regressions which correlated with inhibition of pRb phosphorylation.

In vivo studies using patient-derived oestrogen receptor-positive breast cancer xenograft model combinations of ribociclib and antioestrogens (i.e. letrozole) resulted in superior tumour growth inhibition with sustained tumour regression and delayed tumour regrowth after stopping dosing compared to each substance alone. When administered to patients ribociclib can also be immunomodulatory, decreasing regulatory T-cells and relative levels of CD3+ T-cells. Additionally, *in vivo* antitumour activity of ribociclib in combination with fulvestrant was assessed in immune-deficient mice bearing the ZR751 ER+ human breast cancer xenografts and the combination with fulvestrant resulted in complete tumour growth inhibition.

When tested in a panel of breast cancer cell lines with known ER status, ribociclib demonstrated to be more efficacious in ER+ breast cancer cell lines than in the ER- ones. In the preclinical models tested so far, intact pRb was required for ribociclib activity.

Cardiac electrophysiology
Serial, triplicate ECGs were collected following a single dose and at steady state to evaluate the effect of ribociclib on the QTc interval in patients with advanced cancer. A pharmacokinetic-pharmacodynamic analysis included a total of 997 patients treated with ribociclib at doses ranging from 50 to 1200 mg. The analysis suggested that ribociclib causes concentration-dependent increases in the QTc interval.

In patients with advanced or metastatic breast cancer t~~T~~he estimated QTcF mean change from baseline for 600 mg Kisqali in combination with NSAI or fulvestrant was 22.0 msec (90% CI: 20.56, 23.44) and 23.7 msec (90% CI: 22.31, 25.08), respectively at the geometric mean C_{max} at steady-state compared to 34.7 msec (90% CI: 31.64, 37.78) in combination with tamoxifen (see section 4.4).

In patients with early breast cancer a similar concentration-dependent increase in the QTc interval exists. The estimated QTcF mean change from baseline is estimated to be lower in patients with early breast cancer treated with 400 mg Kisqali compared to patients with advanced or metastatic breast cancer treated with 600 mg Kisqali.

Clinical efficacy and safety

Early breast cancer
Study CLEE011O12301C (NATALEE)
Kisqali was evaluated in a randomised, open-label, multicentre phase III clinical study in the treatment of pre-/postmenopausal women, and of men, with HR-positive, HER2-negative, early breast cancer with anatomic stage II or III irrespective of nodal status at high risk of recurrence in combination with an aromatase inhibitor (AI, letrozole or anastrozole) versus AI alone that was:

- Anatomic stage group IIB-III, or
- Anatomic stage group IIA that is either:
  - Node positive or
  - Node negative, with:
    - Histologic grade 3, or
    - Histologic grade 2, with any of the following criteria:
      - Ki67 ≥20%
      - High risk by gene signature testing

Premenopausal women, and men, also received goserelin. Applying TNM criteria, NATALEE included patients with any lymph node involvement or if no nodal involvement either tumour size >5 cm, or tumour size 2-5 cm with either grade 2 (and high genomic risk or Ki67 ≥20%) or grade 3.

A total of 5 101 patients, including 20 male patients, were randomised in a 1:1 ratio to receive either Kisqali 400 mg and AI (n=2 549) or AI alone (n=2 552). Randomisation to the treatment was stratified by anatomic stage (group II [n=2 154 (42.2%)] versus group III [n=2 947 (57.8%)]), prior treatment (neoadjuvant/adjuvant chemotherapy Yes [n=4 432 (86.9%)] versus No [n=669 (13.1%)]), menopausal status (premenopausal women and men [n=2 253 (44.2%)] versus postmenopausal women [n=2 848 (55.8%)]) and region (North America/Western Europe/Oceania [n=3 128 (61.3%)] versus rest of the world [n=1 973 (38.7%)]). Kisqali was given orally at a dose of 400 mg once daily for 21 consecutive days followed by 7 days off treatment in combination with letrozole 2.5 mg or anastrozole 1 mg orally once daily for 28 days. Goserelin was given at a dose of 3.6 mg as injectable subcutaneous implant administered on day 1 of each 28-day cycle. Therapy with Kisqali continued until completion of 3-year treatment from the randomisation date (approximately 39 cycles).

Patients enrolled in this study had a median age of 52 years (range 24 to 90). 15.2% patients were aged 65 years and older, including 123 patients (2.4%) aged 75 years and older. The patients included were Caucasian (73.4%), Asian (13.2%) and Black or African American (1.7%). All patients had an ECOG performance status of 0 or 1. A total of 88.2% of patients had received chemotherapy in the neoadjuvant or adjuvant setting and 71.6% had received endocrine therapy in the neoadjuvant or adjuvant setting within 12 months prior to study entry.

The primary endpoint for the study was invasive disease-free survival (iDFS) defined as the time from randomisation to the first occurrence of: local invasive breast recurrence, regional invasive recurrence, distant recurrence, death (any cause), contralateral invasive breast cancer, or second primary non-breast invasive cancer (excluding basal and squamous cell carcinomas of the skin).

The primary endpoint of the study was met at the primary analysis (11 January 2023 cut-off). A statistically significant improvement in iDFS (HR: 0.748, 95% CI: 0.618, 0.906; one-sided stratified log-rank test p-value 0.0014) was demonstrated in patients receiving Kisqali plus AI over AI alone. Consistent results were observed across sub-groups of anatomic stage, menopausal status, region, nodal status, age, race, and prior adjuvant/neo-adjuvant chemotherapy or hormonal therapies.

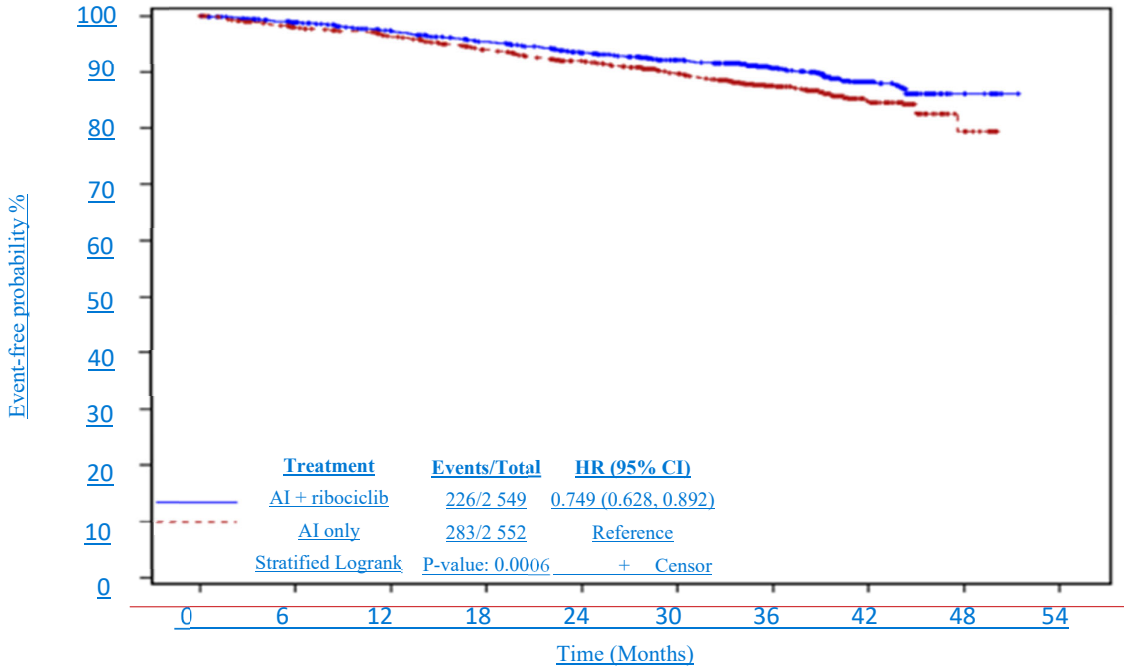
Data from a further analysis (21 July 2023 cut-off) is summarised in Table 8, the Kaplan-Meier curve for iDFS is provided in Figure 1. The median treatment duration at the time of the final iDFS analysis was approximately 30 months with the median follow-up time for iDFS 33.3 months across the two study arms. The overall survival (OS) remains immature. A total of 172 patients (3.5%) had died (83/2 525 in the ribociclib arm versus 89/2 442 in the AI alone arm, HR 0.892, 95% CI: 0.661, 1.203).

Table 8 NATALEE - Efficacy results (iDFS) based on investigator assessment (FAS) (21 July 2023 cut-off)

	Kisqali plus AI* N=2 549	AI N=2 552
Invasive disease-free survival (iDFS[a])		
Number of patients with an event (n, %)	226 (8.9%)	283 (11.1%)
Hazard ratio (95% CI)	0.749 (0.628, 0.892)	
p-value[b]	0.0006	
iDFS at 36 months (%, 95% CI)	90.7 (89.3, 91.8)	87.6 (86.1, 88.9)

CI=confidence interval; N=number of patients.
[a] iDFS defined as the time from randomisation to the first occurrence of: local invasive breast recurrence, regional invasive recurrence, distant recurrence, death (any cause), contralateral invasive breast cancer, or second primary non-breast invasive cancer (excluding basal and squamous cell carcinomas of the skin)
[b] nominal p-value is obtained from the one-sided stratified log-rank test.
* Letrozole or anastrozole

Figure 1 NATALEE - Kaplan-Meier plot of iDFS based on investigator assessment (21 July 2023 cut-off)



AI = aromatase inhibitor (letrozole or anastrozole)
P-value from stratified log-rank test is one-sided.

There were 204 (8.0%) distant disease-free survival (DDFS) events in the Kisqali plus AI arm compared to 256 (10%) events in the AI alone arm (HR: 0.749, 95% CI: 0.623, 0.900).

Advanced breast cancer

Study CLEE011A2301 (MONALEESA-2)
Kisqali was evaluated in a randomised, double-blind, placebo-controlled, multicentre phase III clinical study in the treatment of postmenopausal women with hormone receptor-positive, HER2-negative,

advanced breast cancer who received no prior therapy for advanced disease in combination with letrozole versus letrozole alone.

A total of 668 patients were randomised in a 1:1 ratio to receive either Kisqali 600 mg and letrozole (n=334) or placebo and letrozole (n=334), stratified according to the presence of liver and/or lung metastases (Yes [n=292 (44%)]) versus No [n=376 (56%)]). Demographics and baseline disease characteristics were balanced and comparable between study arms. Kisqali was given orally at a dose of 600 mg daily for 21 consecutive days followed by 7 days off treatment in combination with letrozole 2.5 mg once daily for 28 days. Patients were not allowed to cross over from placebo to Kisqali during the study or after progression of disease.

Patients enrolled in this study had a median age of 62 years (range 23 to 91). 44.2% patients were aged 65 years and older, including 69 patients older than 75 years. The patients included were Caucasian (82.2%), Asian (7.6%), and Black (2.5%). All patients had an ECOG performance status of 0 or 1. In the Kisqali arm 46.6% of patients had received chemotherapy in the neoadjuvant or adjuvant setting and 51.3% had received antihormonal therapy in the neoadjuvant or adjuvant setting prior to study entry. 34.1% of patients were *de novo*. 22.0% of patients had bone-only disease and 58.8% of patients had visceral disease. Patients with prior (neo) adjuvant therapy with anastrozole or letrozole must have completed this therapy at least 12 months before study randomisation.

Primary analysis
The primary endpoint for the study was met at the planned interim analysis conducted after observing 80% of targeted progression-free survival (PFS) events using Response Evaluation Criteria in Solid Tumours (RECIST v1.1), based on the investigator assessment in the full population (all randomised patients), and confirmed by a blinded independent central radiological assessment.

The efficacy results demonstrated a statistically significant improvement in PFS in patients receiving Kisqali plus letrozole compared to patients receiving placebo plus letrozole in the full analysis set (hazard ratio of 0.556, 95% CI: 0.429, 0.720, one sided stratified log-rank test p-value 0.00000329) with clinically meaningful treatment effect.

The global health status/QoL data showed no relevant difference between the Kisqali plus letrozole arm and the placebo plus letrozole arm.

A more mature update of efficacy data (02 January 2017 cut-off) is provided in Tables ~~8~~9 and ~~9~~10.

Median PFS was 25.3 months (95% CI: 23.0, 30.3) for ribociclib plus letrozole treated patients and 16.0 months (95% CI: 13.4, 18.2) for patients receiving placebo plus letrozole. 54.7% of patients receiving ribociclib plus letrozole were estimated to be progression-free at 24 months compared with 35.9% in the placebo plus letrozole arm.

Table ~~8~~9 MONALEESA-2 - Efficacy results (PFS) based on investigator radiological assessment (02 January 2017 cut-off)

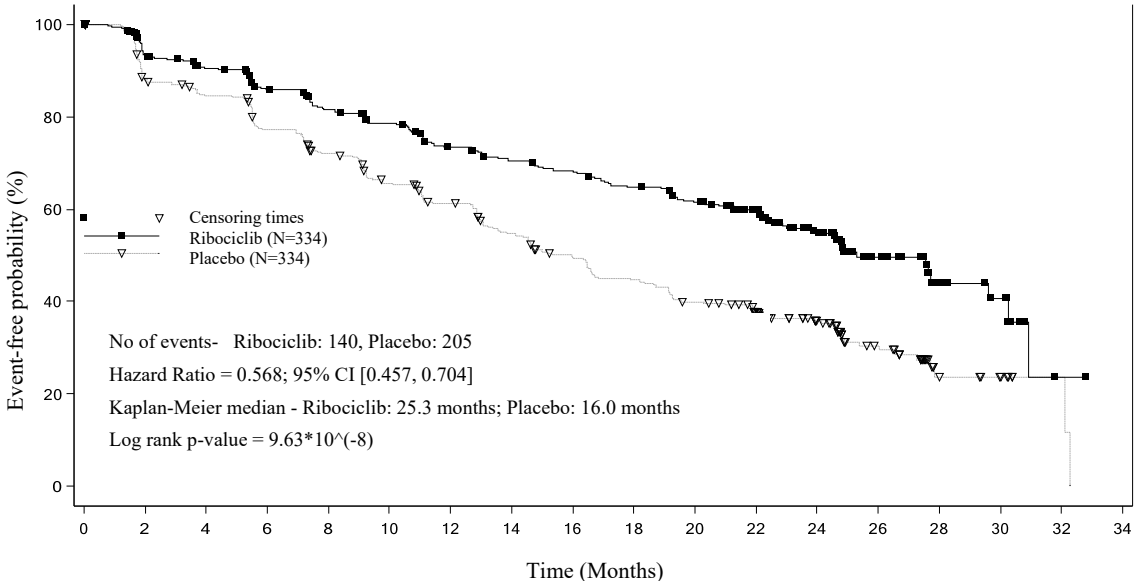
Figure ~~1~~2 MONALEESA-2 - Kaplan-Meier plot of PFS based on investigator assessment (02 January 2017 cut-off)



Number of patients still at risk

Time	0	2	4	6	8	10	12	14	16	18	20	22	24	26	28	30	32	34
Ribociclib	334	294	277	257	240	227	207	196	188	176	164	132	97	46	17	11	1	0
Placebo	334	279	265	239	219	196	179	156	138	124	110	93	63	34	10	7	2	0

A series of pre-specified subgroup PFS analyses was performed based on prognostic factors and baseline characteristics to investigate the internal consistency of treatment effect. A reduction in the risk of disease progression or death in favour of the Kisqali plus letrozole arm was observed in all individual patient subgroups of age, race, prior adjuvant or neoadjuvant chemotherapy or hormonal therapies, liver and/or lung involvement and bone-only metastatic disease. This was evident for patients with liver and/or lung metastases (HR of 0.561 [95% CI: 0.424, 0.743], median progression-free survival [mPFS] 24.8 months for Kisqali plus letrozole versus 13.4 months for letrozole alone), or without liver and/or lung metastases (HR of 0.597 [95% CI: 0.426, 0.837], mPFS 27.6 months versus 18.2 months).

Updated results for overall response and clinical benefit rates are displayed in Table ~~9~~10.

Table ~~9~~10 MONALEESA-2 - Efficacy results (ORR, CBR) based on investigator assessment (02 January 2017 cut-off)

Analysis	Kisqali plus letrozole (%, 95% CI)	Placebo plus letrozole (%, 95% CI)	p-value[c]

One sided P-value is obtained from stratified log rank test.

Study CLEE011E2301 (MONALEESA-7)

Kisqali was evaluated in a randomised, double-blind, placebo-controlled, multicentre phase III clinical study in the treatment of pre- and perimenopausal women with hormone receptor-positive, HER2-negative advanced breast cancer in combination with a NSAI or tamoxifen plus goserelin versus placebo in combination with a NSAI or tamoxifen plus goserelin. Patients in MONALEESA-7 had not received prior endocrine treatment in the advanced breast cancer setting.

A total of 672 patients were randomised in a 1:1 ratio to receive either Kisqali 600 mg plus NSAI/tamoxifen plus goserelin (n=335) or placebo plus NSAI/tamoxifen plus goserelin (n=337), stratified according to: the presence of liver and/or lung metastases (Yes [n=344 (51.2%)] versus No [n=328 (48.8%)]), prior chemotherapy for advanced disease (Yes [n=120 (17.9%)] versus No [n=552 (82.1%)]), and endocrine combination partner (NSAI and goserelin [n=493 (73.4%)] versus tamoxifen and goserelin [n=179 (26.6%)]). Demographics and baseline disease characteristics were balanced and comparable between study arms. Kisqali was given orally at a dose of 600 mg daily for 21 consecutive days followed by 7 days off treatment in combination with NSAI (letrozole 2.5 mg or anastrozole 1 mg) or tamoxifen (20 mg) orally once daily for 28 days, and goserelin (3.6 mg) subcutaneously every 28 days, until disease progression or unacceptable toxicity. Patients were not allowed to cross over from placebo to Kisqali during the study or after disease progression. Switching the endocrine combination partners was also not permitted.

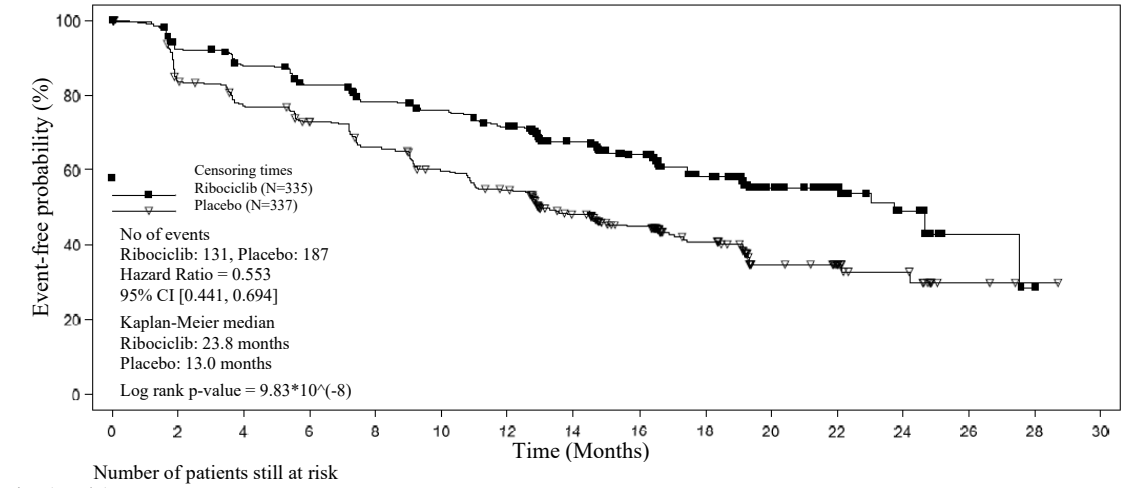
Patients enrolled in this study had a median age of 44 years (range 25 to 58) and 27.7% of patients were younger than 40 years old. The majority of patients included were Caucasian (57.7%), Asian (29.5%) or Black (2.8%) and nearly all patients (99.0%) had a baseline ECOG performance status of 0 or 1. Prior to study entry, of these 672 patients, 14% of patients had received prior chemotherapy for metastatic disease, 32.6% of patients had received chemotherapy in the adjuvant and 18.0% in the neoadjuvant setting; 39.6% had received endocrine therapy in the adjuvant setting and 0.7% in the neoadjuvant setting. In study E2301 40.2% of patients had *de novo* metastatic disease, 23.7% had bone-only disease, and 56.7% had visceral disease.

The study met the primary endpoint at the primary analysis conducted after 318 progression-free survival (PFS) events based on the investigator assessment using RECIST v1.1 criteria in the full analysis set (all randomised patients). The primary efficacy results were supported by PFS results based on blinded independent central radiological assessment. The median follow-up time at the time of primary PFS analysis was 19.2 months.

In the overall study population, the efficacy results demonstrated a statistically significant improvement in PFS in patients receiving Kisqali plus NSAI/tamoxifen plus goserelin compared to patients receiving placebo plus NSAI/tamoxifen plus goserelin (hazard ratio of 0.553, 95% CI: 0.441, 0.694, one-sided stratified log-rank test p-value 9.83×10^{-8}) with clinically meaningful treatment effect. Median PFS was 23.8 months (95% CI: 19.2, NE) for Kisqali plus NSAI/tamoxifen plus goserelin treated patients and 13.0 months (95% CI: 11.0, 16.4) for patients receiving placebo plus NSAI/tamoxifen plus goserelin.

Distribution of PFS is summarised in the Kaplan-Meier curve for PFS in Figure ~~3~~4.

Figure ~~3~~4 MONALEESA-7 - Kaplan-Meier plot of PFS in overall population based on investigator assessment



Number of patients still at risk

Time (months)	0	2	4	6	8	10	12	14	16	18	20	22	24	26	28	30
Ribociclib	335	301	284	264	245	235	219	178	136	90	54	40	20	3	1	0
Placebo	337	273	248	230	207	183	165	124	94	62	31	24	13	3	1	0

The results for PFS based on the blinded independent central radiological assessment of a randomly selected subset of approximately 40% of randomised patients were supportive of the primary efficacy results based on the investigator's assessment (hazard ratio of 0.427; 95% CI: 0.288, 0.633).

At the time of the primary PFS analysis overall survival data were not mature with 89 (13%) of deaths (HR 0. 916 [95% CI: 0.601, 1.396]).

Overall response rate (ORR) per investigator assessment based on RECIST v1.1 was higher in the Kisqali arm (40.9%; 95% CI: 35.6, 46.2) compared to the placebo arm (29.7%; 95% CI: 24.8, 34.6, p=0.00098). The observed clinical benefit rate (CBR) was higher in Kisqali arm (79.1%; 95% CI: 74.8:83.5) compared to placebo arm (69.7%; 95% CI: 64.8:74.6, p=0.002).

In the pre-specified subgroup analysis of 495 patients who had received Kisqali or placebo in combination with NSAI plus goserelin, the median PFS was 27.5 months (95% CI: 19.1, NE) in the Kisqali plus NSAI subgroup and 13.8 months (95% CI: 12.6, 17.4) in the placebo plus NSAI subgroup [HR: 0.569; 95% CI: 0.436, 0.743]. Efficacy results are summarised in Table ~~11~~12 and the Kaplan-Meier curves for PFS are provided in Figure ~~4~~5.

Table ~~11~~12 MONALEESA-7 - Efficacy results (PFS) in patients who received NSAI

Hazard ratio is based on unstratified Cox model.

Additionally, the probability of progression on next-line therapy or death (PFS2) in patients who received prior ribociclib in the study was lower compared to patients in the placebo arm with an HR of 0.692 (95% CI: 0.548, 0.875) in the overall study population. The median PFS2 was 32.3 months (95% CI: 27.6, 38.3) in the placebo arm and was not reached (95% CI: 39.4, NE) for the ribociclib arm. Similar results were observed for the NSAI subgroup, with an HR of 0.660 (95% CI: 0.503, 0.868) and a median PFS2 of 32.3 months (95% CI: 26.9, 38.3) in the placebo arm versus not reached (95% CI: 39.4, NE) in the ribociclib arm.

Study CLEE011F2301 (MONALEESA-3)

Kisqali was evaluated in a 2:1 randomised double-blind, placebo-controlled, multicentre phase III clinical study in 726 postmenopausal women with hormone receptor-positive, HER2-negative advanced breast cancer who had received no or only one line of prior endocrine treatment, in combination with fulvestrant versus fulvestrant alone.

Patients enrolled in this study had a median age of 63 years (range 31 to 89). 46.7% of patients were of age 65 years and older, including 13.8% patients of age 75 years and older. The patients included were Caucasian (85.3%), Asian (8.7%) or Black (0.7%) and nearly all patients (99.7%) had an ECOG performance status of 0 or 1. First and second line patients were enrolled in this study (of whom 19.1% had *de novo* metastatic disease). Prior to study entry 42.7% of patients had received chemotherapy in the adjuvant and 13.1% in the neoadjuvant setting, while 58.5% had received endocrine therapy in the adjuvant and 1.4% in the neoadjuvant setting and 21% had received prior endocrine therapy in the advanced breast cancer setting. In study F2301 21.2% had bone-only disease and 60.5% had visceral disease.

Primary analysis

The study met the primary endpoint at the primary analysis conducted after 361 progression-free survival (PFS) events based on the investigator assessment and using RECIST v1.1 criteria in the full analysis set (all randomised patients, 03 November 2017 cut-off). The median follow-up time at the time of primary PFS analysis was 20.4 months.

The primary efficacy results demonstrated a statistically significant improvement in PFS in patients receiving Kisqali plus fulvestrant compared to patients receiving placebo plus fulvestrant in the full analysis set (hazard ratio of 0.593, 95% CI: 0.480, 0.732, one-sided stratified log-rank test p-value $4.1x10^{-7}$), with an estimated 41% reduction in relative risk of progression or death in favour of the Kisqali plus fulvestrant arm.

The primary efficacy results were supported by a random central audit of 40% imaging subset by a blinded independent central radiological assessment (hazard ratio of 0.492; 95% CI: 0.345, 0.703).

A descriptive update of PFS was performed at the time of the second OS interim analysis, and the updated PFS results on the overall population and the subgroups based on prior endocrine therapy are summarised in Table ~~14~~ 15 and the Kaplan-Meier curve is provided in Figure ~~7~~8.

Table ~~14~~15 MONALEESA-3 (F2301) - Updated PFS results based on investigator assessment (03 June 2019 cut-off)

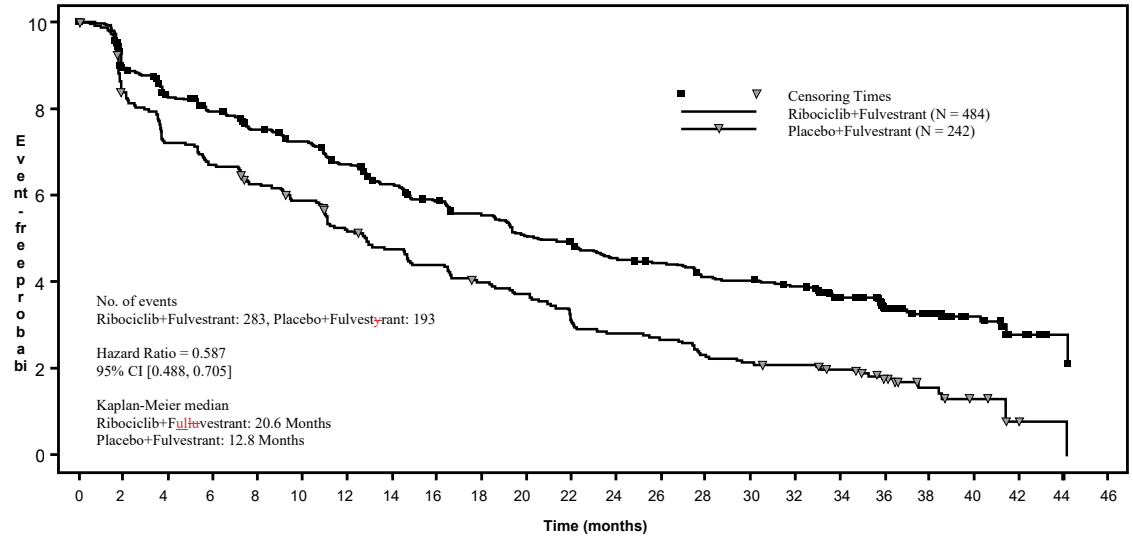
[a] patients with *de novo* advanced breast cancer with no prior endocrine therapy, and patients who relapsed after 12 months of (neo)adjuvant endocrine therapy completion.

[b] patients whose disease relapsed during adjuvant therapy or within 12 months of (neo)adjuvant endocrine therapy completion, and patients who had progression after one line of endocrine therapy for advanced disease.

Figure ~~7~~8 MONALEESA-3 (F2301) – Kaplan-Meier plot of PFS based on investigator assessment (FAS) (03 June 2019 cut-off)



Efficacy results for overall response rate (ORR) and clinical benefit rate (CBR) per investigator assessment based on RECIST v1.1 are provided in Table ~~15~~16.

Table ~~15~~16 MONALEESA-3 - Efficacy results (ORR, CBR) based on investigator assessment (03 November 2017 cut-off)

Analysis	**Kisqali plus fulvestrant (%, 95% CI)**	**Placebo plus fulvestrant (%, 95% CI)**
Full analysis set	**N=484**	**N=242**
Overall response rate (ORR)[a]	32.4 (28.3, 36.6)	21.5 (16.3, 26.7)
Clinical benefit rate (CBR)[b]	70.2 (66.2, 74.3)	62.8 (56.7, 68.9)
Patients with measurable disease	**n=379**	**n=181**
Overall response rate[a]	40.9 (35.9, 45.8)	28.7 (22.1, 35.3)
Clinical benefit rate[b]	69.4 (64.8, 74.0).	59.7 (52.5, 66.8)
[a] ORR: proportion of patients with complete response + partial response [b] CBR: proportion of patients with complete response + partial response + (stable disease or non-complete response/Non-progressive disease ≥24 weeks)		

Hazard ratios based on pre-specified subgroup analysis of the patients treated with Kisqali plus

fulvestrant showed consistent benefit across different subgroups including age, prior treatment (early or advanced), prior adjuvant/neoadjuvant chemotherapy or hormonal therapies, liver and/or lung involvement and bone-only metastatic disease.

OS Analysis
In the second OS analysis the study met its secondary endpoint, demonstrating a statistically significant improvement in OS.

The results from this final OS analysis on the overall study population and the subgroups analysis are provided in Table ~~16~~ 17 and Figure ~~8~~9.

Table ~~16~~17 MONALEESA-3 (F2301) Efficacy results (OS) (03 June 2019 cut-off)

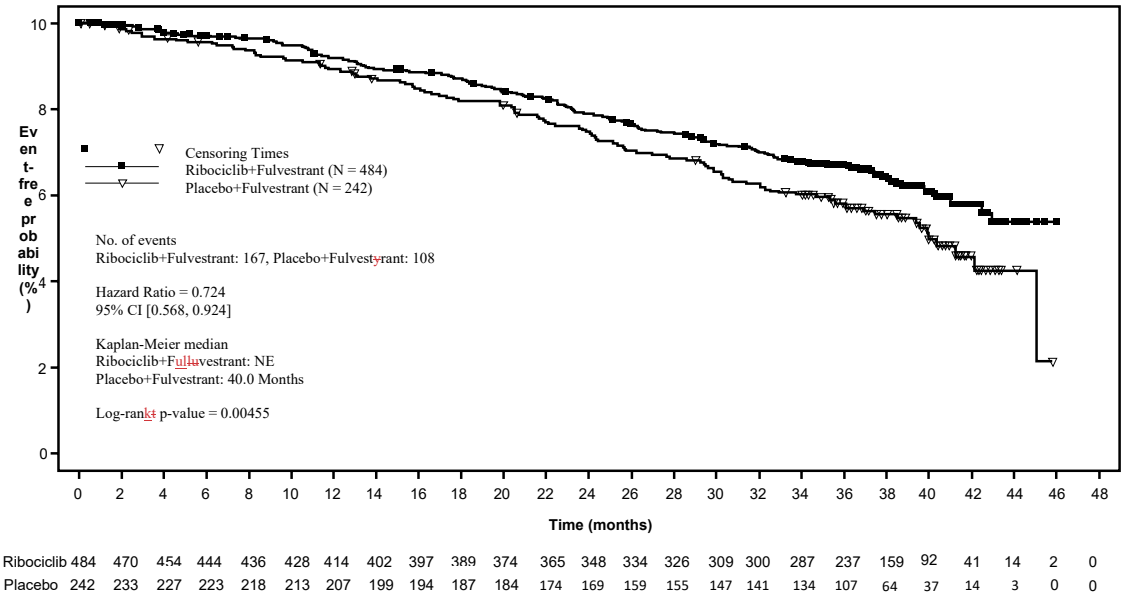
[a] Hazard ratio is obtained from the Cox PH model stratified by lung and/or liver metastasis, previous endocrine therapy.
[b] One-sided P-value is obtained from log-rank test stratified by lung and/or liver metastasis, previous endocrine therapy per IRT. P-value is one-sided and is compared against a threshold of 0.01129 as determined by the Lan-DeMets (O'Brien-Fleming) alpha-spending function for an overall significance level of 0.025.
[c] Hazard ratio is obtained from the unstratified Cox PH model.

Figure ~~8~~9 MONALEESA-3 (F2301) -Kaplan-Meier plot of OS (full analysis set [FAS]) (03 June 2019 cut-off)



Log-rank test and Cox model are stratified by lung and/or liver metastasis, prior chemotherapy for advanced disease, and endocrine combination partner per IRT

Time to progression on next-line therapy or death (PFS2) in patients in the Kisqali arm was longer compared to patients in the placebo arm (HR: 0.670 [95% CI: 0.542, 0.830]) in the overall study population. The median PFS2 was 39.8 months (95% CI: 32.5, NE) for the Kisqali arm and 29.4 months (95% CI: 24.1, 33.1) in the placebo arm.

Elderly patients

Of all patients who received Kisqali in studies MONALEESA-2 and MONALEESA-3, representative proportions of patients were ≥65 years and ≥75 years of age (see section 5.1). No overall differences in safety or effectiveness of Kisqali were observed between these patients and younger patients (see section 4.2).

Patients with renal impairment

In the three pivotal studies (MONALEESA-2, MONALEESA-3 and MONALEESA-7), 510 (53.8%)

patients with normal renal function, 341 (36%) patients with mild renal impairment and 97 (10.2%) patients with moderate renal impairment were treated with ribociclib. No patient with severe renal impairment was enrolled. PFS results were consistent in patients with mild and moderate renal impairment who received ribociclib at the starting dose of 600 mg as compared to those with normal renal function. The safety profile was generally consistent across renal cohorts (see section 4.8).

5.2 Pharmacokinetic properties

The pharmacokinetics of ribociclib were investigated in patients with advanced cancer following oral daily doses of 50 mg to 1200 mg. Healthy subjects received single oral doses ranging from 400 mg to 600 mg or repeated daily doses (8 days) at 400 mg.

Absorption

The geometric mean absolute bioavailability of ribociclib after a single oral dose of 600 mg was 65.8% in healthy subjects.

The time to reach C_{max} (T_{max}) following ribociclib oral administration was between 1 and 4 hours. Ribociclib exhibited slightly over-proportional increases in exposure (C_{max} and AUC) across the dose range tested (50 to 1200 mg). Following repeated once-daily dosing, steady state was generally achieved after 8 days and ribociclib accumulated with a geometric mean accumulation ratio of 2.51 (range: 0.97 to 6.40).

Food effect
Compared to the fasted state, oral administration of a single 600 mg dose of ribociclib film-coated tablets with a high-fat, high-calorie meal had no effect on the rate and extent of absorption of ribociclib.

Distribution

Binding of ribociclib to human plasma proteins *in vitro* was approximately 70% and was independent of concentration (10 to 10000 ng/ml). Ribociclib was equally distributed between red blood cells and plasma with a mean *in vivo* blood-to-plasma ratio of 1.04. The apparent volume of distribution at steady state (Vss/F) was 1090 L based on population pharmacokinetic analysis.

Biotransformation

In vitro and *in vivo* studies indicated ribociclib is eliminated primarily via hepatic metabolism mainly via CYP3A4 in humans. Following oral administration of a single 600 mg dose of [^{14}C] ribociclib to humans, the primary metabolic pathways for ribociclib involved oxidation (dealkylation, C and/or N-oxygenation, oxidation (-2H)) and combinations thereof. Phase II conjugates of ribociclib phase I metabolites involved N-acetylation, sulfation, cysteine conjugation, glycosylation and glucuronidation. Ribociclib was the major circulating drug-derived entity in plasma. The major circulating metabolites included metabolite M13 (CCI284, N-hydroxylation), M4 (LEQ803, N-demethylation), and M1 (secondary glucuronide). Clinical activity (pharmacological and safety) of ribociclib was due primarily to parent drug, with negligible contribution from circulating metabolites.

Ribociclib was extensively metabolised, with unchanged drug accounting for 17.3% and 12.1% of the dose in faeces and urine, respectively. Metabolite LEQ803 was a significant metabolite in excreta and represented approximately 13.9% and 3.74% of the administered dose in faeces and urine, respectively. Numerous other metabolites were detected in both faeces and urine in minor amounts (≤2.78% of the administered dose).

Elimination

The geometric mean plasma effective half-life (based on accumulation ratio) was 32.0 hours (63% CV) and the geometric mean apparent oral clearance (CL/F) was 25.5 l/hr (66% CV) at steady state at

600 mg in patients with advanced cancer. Based on a population pharmacokinetic analysis, the ribociclib exposure in patients with early breast cancer is expected to be slightly lower than in patients with advanced breast cancer treated with the same dose. The geometric mean apparent plasma terminal half-life ($T_{1/2}$) of ribociclib ranged from 29.7 to 54.7 hours and the geometric mean CL/F of ribociclib ranged from 39.9 to 77.5 l/hr at 600 mg across studies in healthy subjects.

Ribociclib and its metabolites are eliminated mainly via faeces, with a small contribution of the renal route. In 6 healthy male subjects, following a single oral dose of [^{14}C] ribociclib, 91.7% of the total administered radioactive dose was recovered within 22 days; faeces was the major route of excretion (69.1%), with 22.6% of the dose recovered in urine.

Linearity/non-linearity

Ribociclib exhibited slightly over-proportional increases in exposure (C_{max} and AUC) across the dose range of 50 mg to 1200 mg following both single dose and repeated doses. This analysis is limited by the small sample sizes for most of the dose cohorts with a majority of the data coming from the 600 mg dose cohort.

Special populations

Renal impairment

The effect of renal function on the pharmacokinetics of ribociclib was assessed in a renal impairment study that included 14 healthy subjects with normal renal function (absolute Glomerular Filtration Rate [aGFR] ≥90 ml/min), 8 subjects with mild renal impairment (aGFR 60 to <90 ml/min), 6 subjects with moderate renal impairment (aGFR 30 to <60 ml/min), 7 subjects with severe renal impairment (aGFR 15 to <30 ml/min) and 3 subjects with end-stage renal disease (ESRD) (aGFR <15 ml/min) at a single ribociclib dose of 400 mg.

AUC_{inf} increased 1.6-fold, 1.9-fold and 2.7-fold and C_{max} increased 1.8- fold, 1.8-fold and 2.3-fold in subjects with mild, moderate and severe renal impairment relative to the exposure in subjects with normal renal function. Since the efficacy and safety studies of ribociclib included a large proportion of patients with mild renal impairment (see section 5.1), data from the subjects with moderate or severe renal impairment in the renal impairment study were also compared with pooled data for the subjects with normal renal function and mild renal impairment. Compared to the pooled data for the subjects with normal renal function and mild renal impairment, AUC_{inf} increased 1.6-fold and 2.2-fold and C_{max} increased 1.5-fold and 1.9-fold in subjects with moderate and severe renal impairment, respectively. A fold difference for subjects with ESRD was not calculated due to the small number of subjects, but results indicate a similar or somewhat larger increase in ribociclib exposure compared to subjects with severe renal impairment.

The effect of renal function on the pharmacokinetics of ribociclib was also assessed in advanced or metastatic breast cancer patients included in efficacy and safety studies where patients were given the 600 mg start dose (see section 5.1). In a sub-group analysis of pharmacokinetic data from studies in advanced or metastatic breast cancer patients following oral administration of 600 mg ribociclib as a single dose or repeat doses, AUC_{inf} and C_{max} of ribociclib in patients with mild (n=57) or moderate (n=14) renal impairment were comparable to the AUC_{inf} and C_{max} in patients with normal renal function (n=86), suggesting no clinically meaningful effect of mild or moderate renal impairment on ribociclib exposure.

Hepatic impairment

Based on a pharmacokinetic study in non-cancer subjects with hepatic impairment, mild hepatic impairment had no effect on the exposure of ribociclib (see section 4.2). The mean exposure for ribociclib was increased less than 2-fold in patients with moderate (geometric mean ratio [GMR]: 1.44 for C_{max}; 1.28 for AUC_{inf}) and severe (GMR: 1.32 for C_{max}; 1.29 for AUC_{inf}) hepatic impairment (see section 4.2).

Based on a population pharmacokinetic analysis that included 160 advanced or metastatic breast cancer patients with normal hepatic function and 47 patients with mild hepatic impairment, mild hepatic impairment had no effect on the exposure of ribociclib, further supporting the findings from the dedicated hepatic impairment study. Ribociclib has not been studied in breast cancer patients with moderate or severe hepatic impairment.

Effect of age, weight, gender and race
Population pharmacokinetic analysis showed that there are no clinically relevant effects of age, body weight or gender on the systemic exposure of ribociclib that would require a dose adjustment. Data on differences in pharmacokinetics due to race are too limited to draw conclusions.

In vitro interaction data

Effect of ribociclib on cytochrome P450 enzymes
In vitro, ribociclib is a reversible inhibitor of CYP1A2, CYP2E1 and CYP3A4/5 and a time-dependent inhibitor of CYP3A4/5, at clinically relevant concentrations. *In vitro* evaluations indicated that ribociclib has no potential to inhibit the activities of CYP2A6, CYP2B6, CYP2C8, CYP2C9, CYP2C19, and CYP2D6 at clinically relevant concentrations. Ribociclib has no potential for time-dependent inhibition of CYP1A2, CYP2C9, and CYP2D6.

In vitro data indicate that ribociclib has no potential to induce UGT enzymes or the CYP enzymes CYP2C9, CYP2C19 and CYP3A4 via PXR. Therefore, Kisqali is unlikely to affect substrates of these enzymes. *In vitro* data are not sufficient to exclude a potential of ribociclib to induce CYP2B6 via CAR.

Effect of transporters on ribociclib
Ribociclib is a substrate for P-gp *in vitro*, but based on mass balance data inhibition of P-gp or BCRP is unlikely to affect ribociclib exposure at therapeutic doses. Ribociclib is not a substrate for hepatic uptake transporters OATP1B1, OATP1B3 or OCT-1 *in vitro*.

Effect of ribociclib on transporters
In vitro evaluations indicated that ribociclib has a potential to inhibit the activities of drug transporters P-gp, BCRP, OATP1B1/1B3, OCT1, OCT2, MATE1 and BSEP. Ribociclib did not inhibit OAT1, OAT3 or MRP2 at clinically relevant concentrations *in vitro*.

5.3 Preclinical safety data

Safety pharmacology

In vivo cardiac safety studies in dogs demonstrated dose and concentration related QTc interval prolongation at an exposure that would be expected to be achieved in patients following the recommended dose of 600 mg. There is also potential to induce incidences of premature ventricular contractions (PVCs) at elevated exposures (approximately 5-fold the anticipated clinical C_{max}).

Repeated-dose toxicity

Repeated-dose toxicity studies (treatment schedule of 3 weeks on/1 week off) of up to 27 weeks' duration in rats and up to 39 weeks' duration in dogs, revealed the hepatobiliary system (proliferative changes, cholestasis, sand-like gallbladder calculi, and inspissated bile) as the primary target organ of toxicity of ribociclib. Target organs associated with the pharmacological action of ribociclib in repeat-dose studies include bone marrow (hypocellularity), lymphoid system (lymphoid depletion), intestinal mucosa (atrophy), skin (atrophy), bone (decreased bone formation), kidney (concurrent degeneration and regeneration of tubular epithelial cells) and testes (atrophy). Besides the atrophic changes seen in the testes, which showed a trend towards reversibility, all other changes were fully reversible after a 4-week treatment-free period. Exposure to ribociclib in animals in the toxicity studies was generally less than or equal to that observed in patients receiving multiple doses of

600 mg/day (based on AUC).

Reproductive toxicity/Fertility

Ribociclib showed foetotoxicity and teratogenicity at doses which did not show maternal toxicity in the rats or rabbits. Following prenatal exposure, increased incidences of post-implantation loss and reduced foetal weights were observed in rats and ribociclib was teratogenic in rabbits at exposures lower than or 1.5 times the exposure in humans, respectively, at the highest recommended dose of 600 mg/day in patients with advanced or metastatic breast cancer based on AUC.

In rats, reduced foetal weights accompanied by skeletal changes considered to be transitory and/or related to the lower foetal weights were noted. In rabbits, there were adverse effects on embryo-foetal development as evidenced by increased incidences of foetal abnormalities (malformations and external, visceral and skeletal variants) and foetal growth (lower foetal weights). These findings included reduced/small lung lobes and additional vessel on the aortic arch and diaphragmatic hernia, absent accessory lobe or (partly) fused lung lobes and reduced/small accessory lung lobe (30 and 60 mg/kg), extra/rudimentary thirteenth ribs and misshapen hyoid bone and reduced number of phalanges in the pollex. There was no evidence of embryo-foetal mortality.

In a fertility study in female rats, ribociclib did not affect reproductive function, fertility or early embryonic development at any dose up to 300 mg/kg/day (which is likely at an exposure lower than or equal to patients' clinical exposure at the highest recommended dose of 600 mg/day based on AUC).

Ribociclib has not been evaluated in male fertility studies. However, atrophic changes in testes were reported in rat and dog toxicity studies at exposures that were less than or equal to human exposure at the highest recommended daily dose of 600 mg/day based on AUC. These effects can be linked to a direct anti-proliferative effects on the testicular germ cells resulting in atrophy of the seminiferous tubules.

Ribociclib and its metabolites passed readily into rat milk. The exposure to ribociclib was higher in milk than in plasma.

Genotoxicity

Genotoxicity studies in bacterial *in vitro* systems and in mammalian *in vitro* and *in vivo* systems with and without metabolic activation did not reveal any evidence for a genotoxic potential of ribociclib.

Carcinogenesis

Ribociclib was assessed for carcinogenicity in a 2-year study in rats.

Oral administration of ribociclib for 2 years resulted in an increased incidence of endometrial epithelial tumours and glandular and squamous hyperplasia in the uterus/cervix of female rats at doses ≥300 mg/kg/day as well as an increased incidence in follicular tumours in the thyroid glands of male rats at a dose of 50 mg/kg/day. Mean exposure at steady state (AUC_{0-24h}) in female and male rats in whom neoplastic changes were seen was 1.2- and 1.4-fold that achieved in patients at the recommended dose of 600 mg/day, respectively. Mean exposure at steady state (AUC_{0-24h}) in female and male rats in whom neoplastic changes were seen was 2.2- and 2.5-fold that achieved in patients at a dose of 400 mg/day, respectively.

Additional non-neoplastic proliferative changes consisted of increased liver altered foci (basophilic and clear cell) and testicular interstitial (Leydig) cell hyperplasia in male rats at doses of ≥5 mg/kg/day and 50 mg/kg/day, respectively.

The mechanism for the thyroid findings in male rats is likely to involve a rodent-specific microsomal enzyme induction in the liver which is considered to be of no relevance to humans. The effects on the uterus/cervix and on the testicular interstitial (Leydig) cells are related to prolonged

hypoprolactinaemia secondary to CDK4 inhibition of lactotrophic cell function in the pituitary gland, altering the hypothalamus-pituitary-gonadal axis.

Any potential increase of oestrogen/progesterone ratio in humans by this mechanism would be compensated by an inhibitory action of concomitant anti-oestrogen therapy on oestrogen synthesis as in humans Kisqali is indicated in combination with oestrogen-lowering agents.

Considering important differences between rodents and humans with regard to synthesis and role of prolactin, this mode of action is not expected to have consequences in humans.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Tablet core

Microcrystalline cellulose
Low-substituted hydroxypropylcellulose
Crospovidone type A
Magnesium stearate
Colloidal anhydrous silica

Film coating

Polyvinyl alcohol (partially hydrolysed)
Titanium dioxide (E171)
Talc
Soya lecithin (E322)
Xanthan gum
Iron oxide black (E172)
Iron oxide red (E172)

6.2 Incompatibilities

Not applicable.

6.3 Shelf life

The expiry date of the product is indicated on the packaging materials.

6.4 Special precautions for storage

Do not store above 30°C. Store in the original package in order to protect from moisture.

6.5 Nature and contents of container

PVC/PCTFE (polyvinylchloride/polychlorotrifluoroethylene)/ALU or PA/ALU/PVC (polyamide/aluminium/polyvinylchloride) blisters containing 14 or 21 film-coated tablets.

Packs containing 21, 42 or 63 film-coated tablets.

Not all pack sizes may be marketed.

6.6 Special precautions for disposal

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. Registration Holder and Importer:

Novartis Israel Ltd., P.O.B ~~7126~~9240, Tel Aviv.

8. Registration number:

עלון לצרכן לפי תקנות הרוקחים (תכשירים) התשמ"ו – 1986
התרופה משווקת על פי מרשם רופא בלבד

קיסקלי 200 מ"ג

טבליות מצופות

חומר פעיל:
כל טבליה מכילה: ריבוציקליב 200 מ"ג (כריבוציקליב סוקסינט 254.40 מ"ג)
ribociclib 200 mg (as ribociclib succinate 254.40 mg)

חומרים בלתי פעילים ואלרגנים בתכשיר: ראה פרק 2 סעיף "מידע חשוב על חלק מהמרכיבים של התרופה" וכן פרק 6 "מידע נוסף".

קרא בעיון את העלון עד סופו בטרם תשתמש בתרופה. עלון זה מכיל מידע תמציתי על התרופה. אם יש לך שאלות נוספות, פנה אל הרופא או הרוקח.
תרופה זו נרשמה לטיפול במחלתך. אל תעביר אותה לאחרים. היא עלולה להזיק להם אפילו אם נראה לך כי מחלתם דומה.

1. למה מיועדת התרופה?

סרטן שד מוקדם
קיסקלי, בשילוב עם מעכב ארומטאז, מיועדת לטיפול משלים (אדג'ובנטי) במטופלים עם סרטן שד חיובי לקולטני הורמונים (HR), שלילי לקולטני גורם גדילה אפידרמלי אנושי 2 (HER2) בשלב מוקדם בסיכון גבוה להישנות.

בנשים בשלב טרום-מנופאוזה (לפני גיל המעבר) או סביב מנופאוזה (גיל המעבר), או בגברים, יש לשלב מעכב ארומטאז עם אגוניסט של הורמון המשחרר הורמון הצהבה (LHRH).

סרטן שד מתקדם או גרורתי
קיסקלי מיועדת לטיפול בשילוב עם:

- מעכב ארומטאז לא סטרואידלי בנשים לפני גיל המעבר, בגיל המעבר או לאחר גיל המעבר, עם סרטן שד מקומי מתקדם או גרורתי, החיוביות ל-HR ושליליות ל-HER2, כטיפול אנדוקריני ראשוני.
- פולבסטרנט בגברים ובנשים לאחר גיל המעבר עם סרטן שד מתקדם או גרורתי החיוביים ל-HR ושליליים ל-HER2, כטיפול אנדוקריני ראשוני או לאחר התקדמות המחלה עם טיפול אנדוקריני.

בנשים בשלב טרום-מנופאוזה (לפני גיל המעבר) או סביב מנופאוזה (גיל המעבר), יש לשלב את הטיפול ההורמונלי עם אגוניסט של LHRH.

קבוצה תרפויטית: מעכבי אנזימים מסוג קינאז תלוי-ציקלין, תרופות לטיפול בסרטן.

קיסקלי מכילה את החומר הפעיל ריבוציקליב, השייך לקבוצה של תרופות הנקראת מעכבי קינאז תלוי-ציקלין 4 ו-6 (cyclin-dependent kinase (CDK) inhibitors).
קיסקלי פועלת על-ידי עצירת איתותי הגדילה המועברים על ידי חלבונים הנקראים קינאזות תלויות-ציקלין 4 ו-6, ועל ידי כך עוצרת תאי סרטן מלגדול ולהתפשט. בסרטן שד מוקדם, היא יכולה למנוע את הישנות הסרטן לאחר הניתוח (טיפול לאחר הניתוח מכונה טיפול משלים (טיפול אדג'ובנטי)). בסרטן שד מתקדם או גרורתי, זה יכול לעכב את התקדמות הסרטן.

אם יש לך שאלות בנוגע לדרך הפעולה של קיסקלי או לסיבה לשמה נרשמה, שאל את הרופא שלך.

2. לפני השימוש בתרופה

אין להשתמש בתרופה אם:

- אתה רגיש (אלרגי) לחומר הפעיל ריבוציקליב, לבוטנים, לסויה או לכל אחד מהמרכיבים הנוספים אשר מכילה התרופה (ראה פרק 6 "מידע נוסף").

אם אתה חושב שייתכן שאתה רגיש, התייעץ עם הרופא~~רופאך~~.

אזהרות מיוחדות הנוגעות לשימוש בתרופה

שוחח עם הרופא שלך, רוקח או אחות לפני נטילת קיסקלי.

לפני הטיפול בקיסקלי ספר לרופא או לרוקח אם:

- יש לך חום, כאב גרון או כיבים בפה עקב זיהומים (סימנים של רמה נמוכה של תאי דם לבנים).
- יש לך בעיות בכבד או אם בעבר היה לך כל סוג של מחלת כבד.
- יש לך או היו לך ליקויים בתפקוד הלב או בקצב הלב, כגון פעימות לב לא סדירות, כולל מצב הנקרא תסמונת מקטע QT מוארך (QT interval prolongation) או רמות נמוכות של אשלגן, מגנזיום, סידן או זרחן בדם.
- סבלת בעבר מקרישתיות יתר או שידוע לך שיש לך גורמי סיכון לקרישתיות יתר.

ספר לרופא שלך או לרוקח אם אחד מהבאים חל עליך במהלך הטיפול בקיסקלי:

- יש לך שילוב של כל אחד מהתסמינים הבאים: פריחה, עור אדום, שלפוחיות בשפתיים, בעיניים או בפה, קילוף עור, חום גבוה, תסמינים דמויי שפעת ובלוטות לימפה מוגדלות (עשויים להיות סימנים של תגובה חמורה בעור).
במקרה של תגובה חמורה בעור, הרופא יבקש ממך להפסיק מיד את הטיפול בקיסקלי.
- אתה חווה בעיות נשימה, שיעול וקוצר נשימה (עלולים להיות סימנים לבעיות ריאה או נשימה).
במידת הצורך, ייתכן שהרופא ירשום לך מינון נמוך יותר, יעצור את הטיפול בקיסקלי או יפסיק אותו לצמיתות.

ילדים ומתבגרים

קיסקלי אינה מיועדת לטיפול בילדים ומתבגרים מתחת לגיל 18.

בדיקות ומעקב

הרופא ינחה אותך לעשות בדיקות דם סדירות לפני ובמהלך הטיפול בקיסקלי כדי לנטר את תפקוד הכבד, רמות תאי הדם (תאי דם לבנים, תאי דם אדומים וטסיות) והאלקטרוליטים (מלחים בדם, כולל אשלגן, סידן, מגנזיום ופוספאט) בגופך. גם פעילות הלב שלך תיבדק לפני ובמהלך הטיפול בקיסקלי באמצעות בדיקה הנקראת אלקטרוקרדיוגרם (ECG (אק"ג) - רשמת לב חשמלית). במידת הצורך, יבוצעו בדיקות נוספות להערכת תפקודי הכליות שלך במהלך הטיפול בקיסקלי. כמו כן, הרופא עשוי להפחית את המינון של קיסקלי או להפסיק את הטיפול באופן זמני, במידת הצורך, כדי לאפשר לכבד, לכליה, לתאי הדם, לרמות האלקטרוליטים או לפעילות הלב להתאושש. הרופא עשוי גם להחליט להפסיק את הטיפול עם קיסקלי לצמיתות.

אינטראקציות/תגובות בין תרופתיות

לפני שאתה מתחיל ליטול קיסקלי, ספר לרופא או לרוקח אם אתה לוקח, אם לקחת לאחרונה או אם אתה עשוי לקחת תרופות אחרות כולל תרופות ללא מרשם, צמחי מרפא ותוספי תזונה, מאחר שהן יכולות להשפיע על אופן ההשפעה של קיסקלי. במיוחד אם אתה לוקח:

- טמוקסיפן, תרופה נוספת לטיפול בסרטן השד.
- תרופות מסוימות המשמשות לטיפול בזיהומים פטריתיים, כגון קטוקונאזול, איטרקונאזול, וריקונאזול או פוסאקונאזול.
- תרופות מסוימות המשמשות לטיפול בנגיף הכשל החיסוני האנושי (HIV/איידס), כגון ריטונביר, סקווינביר, אינדינביר, לופינביר, נלפינביר, טלפרביר ואפאבירנז.
- תרופות מסוימות המשמשות לטיפול בפרכוסים (אנטי אפילפטיות), כגון קרבמזפין ופניטואין.

- סנט ג'ונס וורט (הידוע גם *כהיפריקום פרפורטום*) - תרופה צמחית המשמשת לטיפול בדיכאון ובמצבים אחרים.
- תרופות מסוימות המשמשות לטיפול בהפרעות קצב לב או לחץ דם גבוה, כגון אמיודארון, דיזופיראמיד, פרוקאינאמיד, כינידין, סוטלול ווראפאמיל.
- תרופות לטיפול במלריה, כגון כלורוקווין.
- אנטיביוטיקות, כגון קלריתרומיצין, טליתרומיצין, מוקסיפלוקסאצין, ריפמפיצין, ציפרופלוקסצין, לבופלוקסצין ואזיתרומיצין.
- תרופות מסוימות המשמשות להרגעה או להרדמה, כגון מידאזולם.
- תרופות מסוימות המשמשות ~~לטיפול בבעיות פסיכוטיות~~כנוגדות פסיכוזה, כגון הלופרידול או פסיכיאטריות, כגון נפזודון.
- תרופות המשמשות לטיפול בתעוקת חזה, כגון בפרידיל.
- מתדון, המשמשת לטיפול בכאב או בהתמכרות לאופיואידים.
- תרופות כמו אונדאנסטרון במתן תוך ורידי, המשמשות למניעת בחילה והקאה הנגרמות כתוצאה מכימותרפיה (טיפול עם תרופות לסרטן).

קיסקלי עלולה להעלות או להוריד את הרמות בדם של תרופות אחרות. זה כולל במיוחד:
- תרופות המשמשות לטיפול בתסמינים של הגדלה שפירה של הערמונית, כגון אלפוזוסין.
- טמוקסיפן, תרופה נוספת המשמשת לטיפול בסרטן השד.
- תרופות נוגדות הפרעות קצב בלב (אנטי אריתמיות), כגון אמיודארון או כינידין.
- תרופות המשמשות כנוגדות פסיכוזה~~לטיפול בבעיות פסיכוטיות~~, כגון פימוזיד או קוויטיאפין.
- תרופות המשמשות לשיפור רמות שומנים בדם, כגון סימבסטטין, לובסטטין, פיטבסטטין, פרבסטטין או רוזובסטטין.
- תרופות המשמשות לטיפול ברמות גבוהות של סוכר בדם (לדוגמה סוכרת), כגון מטפורמין.
- תרופות המשמשות לטיפול בבעיות בלב, כגון דיגוקסין.
- תרופות המשמשות לטיפול ביתר לחץ דם עורקי ריאתי ובעיות בזקפה (אין אונות), כגון סילדנאפיל.
- תרופות המשמשות לטיפול בלחץ דם נמוך או במיגרנה, כגון ארגוטמין או דיהידרוארגוטמין.
- תרופות מסוימות המשמשות לטיפול בהתקפים אפילפטיים או משמשות להרגעה או להרדמה, כגון מידאזולם.
- תרופות המשמשות לטיפול בהפרעות שינה, כגון טריאזולם.
- תרופות לשיכוך כאבים, כגון אלפנטניל ופנטניל.
- תרופות המשמשות לטיפול בבעיות במערכת העיכול, כגון ציסאפריד.
- תרופות המשמשות למניעת דחייה של השתלת איברים, כגון טקרולימוס, סירולימוס וציקלוספורין (המשמשת גם לטיפול בדלקת מפרקים שיגרונית ובספחת).
- אוורולימוס, המשמשת לטיפול במספר סוגים של סרטן ובטרשת קרשית (משמשת גם למניעת דחייה של השתלת איברים).

שאל את הרופא או רוקח אם אתה לא בטוח אם התרופה שלך היא אחת מהתרופות הרשומות לעיל.

שימוש בתרופה ומזון
אין לאכול אשכוליות או מזון המכיל אשכוליות או לשתות מיץ המכיל אשכולית במהלך הטיפול בקיסקלי.
אלה עלולים לשנות את אופן הפירוק של קיסקלי בגופך ולהעלות את הכמות של קיסקלי בזרם הדם.
ניתן ליטול קיסקלי עם או בלי אוכל.

היריון, הנקה ופוריות
אם את בהיריון או מיניקה, חושבת שאת יכולה להיות בהיריון או מתכננת להרות, היוועצי ברופא לפני נטילת תרופה זו.
הרופא ידון איתך על הסיכונים האפשריים בנטילת קיסקלי במהלך ההיריון.

היריון ונשים שיש להן אפשרות להיכנס להיריון
אין להשתמש בקיסקלי במהלך ההיריון מאחר שהיא עלולה לפגוע בעובר שלך. אם את אישה בגיל הפוריות עלייך לעבור בדיקת היריון ולקבל תוצאה שלילית לפני התחלת הטיפול עם קיסקלי. עלייך להשתמש באמצעי מניעה יעיל (למשל אמצעי מניעה חוצץ כפול כגון קונדום ודיאפרגמה) בזמן נטילת קיסקלי ולפחות 21 ימים לאחר המנה האחרונה. שאלי את הרופא על אפשרויות לאמצעי מניעה יעיל.

הנקה
אין להיניק בזמן נטילת קיסקלי ולפחות 21 ימים לאחר המנה האחרונה.

נהיגה ושימוש במכונות
טיפול בקיסקלי עלול לגרום לעייפות, סחרחורת או לתחושת סיחרור. לכן, עליך להיות זהיר בזמן נהיגה או שימוש במכונות במהלך הטיפול בקיסקלי.

מידע חשוב על חלק מהמרכיבים של התרופה
קיסקלי מכילה לציטין סויה (0.344 מ"ג בטבליה).
אל תשתמש בתרופה זו אם אתה אלרגי לבוטנים או סויה.

3. כיצד תשתמש בתרופה?

יש להשתמש בתכשיר תמיד בהתאם להוראות הרופא.
עליך לבדוק עם הרופא או הרוקח אם אינך בטוח בנוגע למינון ואופן הטיפול בתרופה. אין לשנות את המנה או את לוח הזמנים של קיסקלי מבלי לדבר עם הרופא.
המינון ואופן הטיפול יקבעו על-ידי הרופא בלבד. המינון המקובל בדרך כלל הוא:

	מינון התחלתי מומלץ של קיסקלי	**מספר טבליות**
סרטן שד מוקדם	400 מ"ג פעם ביום	2 טבליות של 200 מ"ג
סרטן שד מתקדם או גרורתי	600 מ"ג פעם ביום	3 טבליות של 200 מ"ג
הערה: מחזור טיפול נמשך 28 ימים. יש ליטול קיסקלי פעם ביום רק בימים 1 עד 21 במחזור של 28 יום. **אין ליטול קיסקלי בימים 22-28 של מחזור הטיפול.**		

הרופא יגיד לך בדיוק כמה טבליות של קיסקלי ליטול; במצבים מסוימים (לדוגמה במקרים של בעיות בכליה או בכבד), הרופא עשוי להנחות אותך לקחת מינון נמוך יותר של קיסקלי, ~~למשל 400 מ"ג (2 טבליות של 200 מ"ג) פעם ביום או 200 מ"ג (1 טבליה של 200 מ"ג) פעם ביום.~~

אין לעבור על המנה המומלצת.

חשוב מאוד לעקוב אחרי הוראות הרופא. אם יש לך תופעות לוואי מסוימות, ייתכן שהרופא ירשום לך מינון נמוך יותר, יעצור את הטיפול בקיסקלי, או יפסיק אותו לצמיתות.

צורת הנטילה
יש ליטול קיסקלי פעם ביום באותה שעה בכל יום, רצוי בבוקר. הדבר יסייע לך לזכור מתי ליטול את התרופה ולשים לב לכל תופעת לוואי שעשויה להתרחש על מנת שתוכל ליצור קשר עם הרופא שלך בהקדם.
יש לבלוע את טבליות קיסקלי בשלמותן (אין מידע לגבי כתישה/חצייה/לעיסה). אין ליטול טבליה שבורה, סדוקה או פגומה בצורה אחרת.

משך הטיפול
יש ליטול קיסקלי פעם ביום בימים 1 עד 21 במחזור טיפול של 28 יום.

בסרטן שד מוקדם, משך הטיפול המרבי המומלץ הוא 3 שנים. בסרטן שד מתקדם או גרורתי, הטיפול בקיסקלי הוא טיפול ארוך טווח~~מתמשך~~. הרופא ינטר באופן קבוע את מצבך הרפואי כדי לבדוק שהטיפול מועיל ואינו גורם להשפעה בלתי רצויה. יש להמשיך בטיפול בקיסקלי כל עוד הרופא מורה לך לעשות זאת.

אם נטלת בטעות מינון גבוה יותר של קיסקלי
אם נטלת מנת יתר או אם בטעות מישהו אחר בלע מן התרופה, פנה מיד לרופא או לחדר מיון של בית חולים והבא את אריזת התרופה איתך. ייתכן שיהיה צורך בטיפול רפואי.

אם שכחת ליטול קיסקלי
אם הקאת לאחר לקיחת מנה או שכחת מנה, דלג על המנה באותו יום. קח את המנה הבאה במועד הרגיל. אין ליטול מנה כפולה כדי לפצות על מנה שנשכחה. במקום זאת, המתן וקח את המנה המתוכננת הבאה בזמן הרגיל ביום למחרת.

יש להתמיד בטיפול כפי שהומלץ על-ידי הרופא.

אם אתה מפסיק ליטול קיסקלי
אם אתה חושב שהמנה שאתה לוקח גבוהה או נמוכה מדי, פנה לרופא. אין להפסיק את הטיפול בתרופה ללא הוראת הרופא. הפסקת הטיפול בקיסקלי עלולה לגרום להחמרה במצבך.

אין ליטול תרופות בחושך! בדוק התווית והמנה בכל פעם שהינך נוטל תרופה. הרכב משקפיים אם הינך זקוק להם.

אם יש לך שאלות נוספות בנוגע לשימוש בתרופה, היוועץ ברופא, רוקח או אחות.

4. תופעות לוואי

כמו בכל תרופה, השימוש בקיסקלי עלול לגרום לתופעות לוואי בחלק מהמשתמשים. אל תיבהל למקרא רשימת תופעות הלוואי. ייתכן שלא תסבול מאף אחת מהן. קרא חלק זה בעיון. תופעות לוואי שעלולות להיות חמורות מפורטות בהתחלה **("חלק מתופעות הלוואי עלולות להיות חמורות")** ולאחר מכן מפורטות כל תופעות הלוואי האפשריות הנוספות **("תופעות לוואי ~~אפשריות~~ נוספות")** בסדר יורד של התדירות.

סרטן שד מוקדם
חלק מתופעות הלוואי עלולות להיות חמורות.
הרופא עשוי לבקש ממך ליטול מינון נמוך יותר, להשהות את הטיפול בקיסקלי או להפסיק אותו לצמיתות. יש לפנות מייד לרופא אם מופיעה אחת מהתופעות הבאות במהלך הטיפול עם קיסקלי:

- חום, הזעה או צמרמורת, שיעול, תסמינים דמויי שפעת, ירידה במשקל, קוצר נשימה, דם בליחה, פצעים על פני הגוף, אזורים חמים או כואבים על פני הגוף, שלשול או כאב בטן, או תחושת עייפות קיצונית (סימנים או תסמינים של זיהומים). *תופעות שכיחות מאוד (מופיעות ביותר ממשתמש אחד מעשרה).*
- חום, צמרמורת, חולשה וזיהומים תכופים עם תסמינים כגון כאב גרון או כיבים בפה. אלה עלולים להיות סימנים לרמה נמוכה של תאי דם לבנים, *תופעה שכיחה מאוד (מופיעה ביותר ממשתמש אחד מעשרה),* או לרמה נמוכה של לימפוציטים, שהם סוג ספציפי של תאי דם לבנים. *תופעה שכיחה (מופיעה ב-1-10 משתמשים מתוך 100).*
- תוצאות בלתי תקינות בבדיקות דם הנותנות מידע על בריאות הכבד (תוצאות בלתי תקינות בבדיקות תפקודי כבד). *תופעה שכיחה מאוד (מופיעה ביותר ממשתמש אחד מעשרה).*
- דימומים או שטפי דם (חבורות) ספונטניים (סימנים לרמה נמוכה של טסיות בדם). *תופעה שכיחה (מופיעה ב-1-10 משתמשים מתוך 100).*
- ירידה ברמת האשלגן בדם, אשר עלולה להוביל להפרעות בקצב הלב. *תופעה שכיחה (מופיעה ב-1-10 משתמשים מתוך 100).*

- כאב או אי-נוחות בחזה, שינויים בקצב הלב (מהיר או איטי), דפיקות לב (פלפיטציות), תחושת סחרור, עילפון, סחרחורת, הכחלת השפתיים, קוצר נשימה, נפיחות (בצקת) בגפיים התחתונים או בעור (אלה עלולים להיות סימנים לבעיות לב). *תופעות שכיחות (מופיעות ב-10-1 משתמשים מתוך 100).*
- עייפות, עור צהוב מגרד או הצהבת לובן העיניים, בחילות או הקאות, חוסר תיאבון, כאב בצד הימני העליון של הבטן, שתן כהה או חום, דימומים או שטפי דם (חבורות) הנוצרים בקלות רבה יותר לעומת המצב הרגיל (אלה עלולים להיות סימנים לבעיית כבד). *תופעות שכיחות (מופיעות ב-10-1 משתמשים מתוך 100).*
- דלקת ריאות, אשר יכולה לגרום לשיעול יבש, כאב בחזה, חום, קוצר נשימה וקושי בנשימה (אלה עלולים להיות סימנים למחלת ריאות אינטרסטיציאלית/דלקת ברקמת הריאה (פנאומוניטיס), אשר עלולה להיות מסכנת חיים אם היא חמורה). *תופעה שכיחה (מופיעה ב-10-1 משתמשים מתוך 100).*
- כאב גרון או כיבים בפה עם אירוע יחיד של חום לפחות 38.3°C או חום של 38°C ומעלה למשך יותר משעה ו/או עם זיהום (נויטרופניה המלווה בחום). *תופעות שאינן שכיחות (מופיעות ב-10-1 משתמשים מתוך 1,000).*

תופעות לוואי נוספות

תופעות לוואי שכיחות מאוד *(תופעות שמופיעות ביותר ממשתמש אחד מעשרה)*

- כאב גרון, נזלת, חום (סימנים לזיהום בדרכי הנשימה)
- מתן שתן תכוף המלווה בכאב (סימנים לזיהום בדרכי השתן)
- בחילות
- כאב ראש
- תשישות (עייפות)
- אסתניה (חולשה)
- התקרחות (נשירת שיער או הידללות שיער)
- שלשול
- עצירות
- שיעול
- כאב בטן
- חום

תופעות לוואי שכיחות *(תופעות שמופיעות ב-10-1 משתמשים מתוך 100)*

- פריחה
- סחרחורת או תחושת סחרור
- עייפות, עור חיוור (סימן אפשרי לרמה נמוכה של תאי דם אדומים, אנמיה)
- הקאות
- גרד
- בצקת היקפית (נפיחות בכפות הידיים, בקרסוליים או בכפות הרגליים)
- קוצר נשימה, קושי בנשימה
- סטומטיטיס (פצעים בפה עם דלקת בחניכיים)
- כאב בפה ובלוע (כאב גרון)
- ירידה ברמת הסידן בדם, אשר עלולה לעיתים להוביל להתכווצות שרירים
- ירידה בתיאבון
- תוצאה בלתי תקינה בבדיקת דם לתפקודי כליות (רמת קריאטינין גבוהה בדם)

סרטן שד מתקדם או גרורתי

חלק מתופעות הלוואי עלולות להיות חמורות

יש לפנות מיד לרופא אם מופיעה אחת מהתופעות הבאות במהלך הטיפול עם קיסקלי. ראה גם פרק 2, "לפני השימוש בתרופה".

- חום, הזעה או צמרמורות, שיעול, תסמינים דמויי שפעת, ירידה~~איבוד~~ במשקל, קוצר נשימה, דם בליחה, פצעים על פני הגוף, אזורים חמים או כואבים על פני הבגוף, שלשול או כאב בטן, או ~~שאתה מרגיש עייף מאוד~~תחושת עייפות קיצונית (סימנים או תסמינים של זיהומים). ~~*שכיח מאוד*~~*תופעות לוואי שכיחות מאד (תופעות שמופיעות ביותר ממשתמש אחד מעשרה).*
- חום, צמרמורות, חולשה וזיהומים תכופים עם תסמינים, כגון כאב גרון או כיבים בפה (סימנים של רמה נמוכה של לויקוציטים או לימפוציטים, שהם סוגים של תאי דם לבנים). *תופעות לוואי שכיחות מאוד (תופעות שמופיעות ביותר ממשתמש אחד מעשרה).*

- תוצאות ~~לא~~בלתי תקינות ~~של~~ בבדיקות הדם, הנותנות מידע על בריאות הכבד (תוצאות ~~לא~~בלתי תקינות ~~של~~בבדיקות תפקודי כבד). *תופע~~י~~ת לוואי שכיח~~ות~~ מאוד (תופע~~י~~ת שמופיע~~ו~~ת ביותר ממשתמש אחד מעשרה).*
- דימומ~~ים~~ או חבורות ללא סיבה (סימנים לרמה נמוכה של טסיות בדם). *תופעות לוואי שכיחות (תופעות שמופיעות ב- 1-10 משתמשים מתוך 100).*
- כאב גרון או ~~פצעים כיבים~~ בפה עם ~~אפיזודה בודדת~~אירוע יחיד של חום של לפחות 38.3°C או חום של ~~מעל ל-~~38°C ומעלה ליותר משעה או/ו עם זיהום (febrile neutropenia). *תופעות לוואי שכיחות (תופעות שמופיעות ב- 1-10 משתמשים מתוך 100).*
- עייפות, עור צהוב מגרד או הצהבת ~~ה~~ל~~ו~~בן ה~~ב~~עיניים, בחיל~~ו~~ת~~ה~~ או הקא~~ו~~ת~~ה~~, ~~או~~בדן חוסר תיאבון, כאב ~~בחלק~~בצד הימני העליון של הבטן, שתן כהה או חום, דימום או חבלה הקורים בקלות יתר מהרגיל (אלה עלולים להיות סימנים ~~של בעי~~~~ה~~לבעיית ~~ב~~כבד). *תופעות לוואי שכיחות (תופעות שמופיעות ב- 1-10 משתמשים מתוך 100).*
- ירידה ברמ~~ו~~ת האשלגן בדם, תופעה היכולה להובילה להפרעות בקצב הלב. *תופעת לוואי שכיחה (תופעה שמופיעה ב- 1-10 משתמשים מתוך 100).*
- כאב או אי-נוחות בחזה, שינויים בקצב הלב (מהיר או איטי), דפיקות לב, תחושת סחרור, ~~התעלפות~~עילפון, סחרחורת, הכחלה של השפתיים, קוצר נשימה, נפיחות (בצקת) של הגפיים ~~התחתונות~~ התחתונים או העור (אלה עלולים להיות סימנים לבעיות לב). *תופעות לוואי שכיחות (תופעות שמופיעות ב- 1-10 משתמשים מתוך 100).*
- דלקת של הריאות שעלולה לגרום לשיעול יבש, כאב בחזה, חום, קוצר נשימה וקשיי נשימה (אלה עשויים להיות סימנים של מחלת ריאה אינטרסטיציאלית/ דלקת ברקמת הריאה (פנאומוניטיס) אשר עלולה להיות מסכנת חיים אם היא חמורה).~~ריאות שכאשר חמורים, הם עלולים להיות מסכני חיים).~~ *תופעות לוואי שכיחות (תופעות שמופיעות ב- 1-10 משתמשים מתוך 100).*
- זיהום חמור עם קצב לב מוגבר, קוצר נשימה או נשימה מהירה, חום וצמרמורות (אלה עלולים להיות סימנים של אלח דם, שהוא זיהום במערכת הדם אשר עלול להיות מסכן חיים). *תופעות לוואי שאינן שכיחות (תופעות שמופיעות ב- 1-10 משתמשים מתוך 1000).*
- תגובה חמורה בעור שעלולה לכלול שילוב של כל אחד מהתסמינים הבאים: פריחה, עור אדום, שלפוחיות בשפתיים, בעיניים או בפה, קילוף עור, חום גבוה, תסמינים דמויי שפעת, בלוטות לימפה מוגדלות (נמק אפידרמי רעלני [toxic epidermal necrolysis, TEN]). *תופעות לוואי ששכיחותן אינה ידועה (לא ניתן להעריך את השכיחות מהנתונים הזמינים).*

~~הרופא עשוי לבקש ממך ליטול מינון נמוך יותר, לעצור את הטיפול בקיסקלי, או להפסיק אותו לצמיתות.~~

תופעות לוואי ~~אפשריות~~נוספות

שכיחות מאוד *(תופעות שמופיעות ביותר ממשתמש אחד מעשרה)*
- עייפות, עור חיוור (סימן אפשרי לרמה נמוכה של תאי דם אדומים, אנמיה)
- כאב גרון, נזלת, חום (סימנים לזיהום בדרכי הנשימה)
- השתנה כואבת ותכופה (סימנים לזיהום בדרכי השתן)
- תיאבון מופחת
- כאב ראש
- סחרחורת או תחושת סחרור
- קוצר נשימה, קשיי נשימה
- שיעול
- בחילה
- שלשול
- הקאה
- עצירות
- כאב בטן
- פצעים בפה עם דלקת חניכיים (סטומטיטיס)

- קשיי עיכול, הפרעות עיכול, צרבת (אי-נוחות או כאבים בבטן העליונה)
- נשירת שיער או הידללות השיער (התקרחות)
- פריחה
- ~~גירוד (~~גרד~~)~~
- כאב גב
- עייפות (תשישות)
- ידיים, קרסוליים או רגליים נפוחות (בצקת היקפית)
- חום
- חולשה

שכיחות *(תופעות שמופיעות ב- 10-1 משתמשים מתוך 100)*
- כאב בטן, בחילה, הקאה ושלשול (סימנים של דלקת קיבה ומעי (גסטרואנטריטיס), שהיא זיהום במערכת העיכול)
- ירידה ברמת סידן בדם, אשר עלולה לפעמים להוביל להתכווציות שרירים
- ירידה ברמת פוספאט בדם
- תחושת סחרור (ורטיגו)
- עיניים דומעות
- עיניים יבשות
- ירידה ברמת האשלגן בדם, אשר עלולה להוביל להפרעות בקצב הלב
- טעם מוזר בפה (עיוות של חוש הטעם)
- עור יבש
- אדמומיות בעור (אריתמה)
- אובדן צבע העור בצורת כתמים (ויטיליגו)
- כאב גרון (כאב בלוע)
- פה יבש
- תוצאה חריגה בבדיקת דם לתפקוד כליות (רמה גבוהה של קריאטינין בדם)

נדירות *(תופעות שמופיעות בעד 1 משתמשים מתוך 1,000)*
תגובה בעור הגורמת לנקודות אדומות או כתמים על העור שייתכן ונראים "לוח מטרה" עם מרכז אדום כהה מוקף בטבעות אדומות בהירות יותר (erythema multiforme).

אם הופיעה תופעת לוואי, אם אחת מתופעות הלוואי מחמירה או כאשר אתה סובל מתופעת לוואי שלא צוינה בעלון, עליך להתייעץ עם הרופא.

דיווח על תופעות לוואי
ניתן לדווח על תופעות לוואי למשרד הבריאות באמצעות לחיצה על הקישור "דיווח על תופעות לוואי עקב טיפול תרופתי" שנמצא בדף הבית של אתר משרד הבריאות (www.health.gov.il) המפנה לטופס המקוון לדיווח על תופעות לוואי, או על-ידי כניסה לקישור:
https://sideeffects.health.gov.il

בנוסף ניתן לדווח לחברת נוברטיס באמצעות כתובת הדואר האלקטרוני הבאה:
Safetydesk.israel@novartis.com

5. איך לאחסן את התרופה?

- מנע הרעלה! תרופה זו וכל תרופה אחרת יש לשמור במקום סגור מחוץ להישג ידם וטווח ראייתם של ילדים ו/או תינוקות ועל-ידי כך תמנע הרעלה. אל תגרום להקאה ללא הוראה מפורשת מהרופא.
- אין להשתמש בתרופה אחרי תאריך התפוגה (exp. date) המופיע על גבי האריזה והמגשית (בליסטר). תאריך התפוגה מתייחס ליום האחרון של אותו חודש.
- אין לאחסן מעל 30°C. יש לאחסן באריזה המקורית על מנת להגן מפני לחות.

- אין להשתמש בתרופה אם הינך מבחין בנזק כלשהו לאריזה או בסימני פגיעה.
- אין להשליך תרופות דרך הביוב או האשפה הביתית. שאל את הרוקח כיצד להשליך תרופות שאינן עוד בשימוש. אמצעים אלה יסייעו בהגנה על הסביבה.

6. מידע נוסף

- נוסף על החומר הפעיל התרופה מכילה גם:
Microcrystalline cellulose; low-substituted hydroxypropylcellulose; crospovidone (type A); magnesium stearate; poly (vinyl alcohol)- partially hydrolyzed; titanium dioxide (E171); talc; colloidal anhydrous silica; lecithin soya (E322); xanthan gum; iron oxide black (E172); iron oxide red (E172).

כל טבליה מכילה 0.344 מ"ג לציטין סויה.
ראה אזהרה בפרק 2 "לפני השימוש בתרופה", ~~תת~~ סעיף: "מידע חשוב על חלק מהמרכיבים של התרופה".

- כיצד נראית התרופה ומה תוכן האריזה:
טבליות קיסקלי הן טבליות מצופות, עגולות, מעוקלות בעלות שוליים משופעים, בצבע סגול אפרפר בהיר, ללא קו חצייה, מוטבעות עם "RIC" בצד אחד ו- "NVR" בצד השני.

הטבליות ארוזות בבליסטרים. האריזות מכילות 21, 42 או 63 טבליות מצופות.

אריזות קיסקלי המכילות 63 טבליות מיועדות לשימוש על-ידי מטופלים הנוטלים את המינון היומי ~~המלא~~ של 600 מ"ג ריבוציקליב (3 טבליות פעם ביום).
אריזות קיסקלי המכילות 42 טבליות מיועדות לשימוש על-ידי מטופלים הנוטלים את המינון היומי ~~המופחת~~ של 400 מ"ג ריבוציקליב (2 טבליות פעם ביום).
אריזות קיסקלי המכילות 21 טבליות מיועדות לשימוש על-ידי מטופלים הנוטלים את המינון היומי הנמוך ביותר, 200 מ"ג ריבוציקליב (1 טבליה פעם ביום).

ייתכן שלא כל גודלי האריזות משווקים.

- בעל הרישום והיבואן וכתובתו: נוברטיס ישראל בע"מ, ת"ד 9240~~71269~~, תל אביב.

- מספר רישום התרופה בפנקס התרופות הממלכתי במשרד הבריאות: 160-68-35298.

לשם הפשטות ולהקלת הקריאה, עלון זה נוסח בלשון זכר. על אף זאת, בחלק מההתוויות המאושרות התרופה מיועדת לנשים בלבד.

נערך ~~בספטמבר~~ בנובמבר 2025~~2024~~.
