

**Patient Safety Information Card**

The marketing of Olumiant 2 and 4 mg is subject to a risk management plan (RMP), including a 'Patient safety information card'. The 'Patient safety information card' emphasizes important safety information that the patient should be aware of before and during treatment.

Please explain to the patient the need to review the card before starting treatment.

**HCP Guide**

This product is marketed with an HCP guide, providing important safety information. Please ensure you are familiar with this material, as it contains important safety information.

**1. NAME OF THE MEDICINAL PRODUCT**

Olumiant 2 mg film-coated tablets

Olumiant 4 mg film-coated tablets

**2. QUALITATIVE AND QUANTITATIVE COMPOSITION**

Olumiant 2 mg film-coated tablets

Each film-coated tablet contains 2 mg baricitinib.

Olumiant 4 mg film-coated tablets

Each film-coated tablet contains 4 mg baricitinib.

For the full list of excipients, see section 6.1.

**3. PHARMACEUTICAL FORM**

Film-coated tablet (tablet)

Olumiant 2 mg film-coated tablets

Light pink, 9 x 7.5 mm oblong tablets, debossed with "Lilly" on one side and "2" on the other.

Olumiant 4 mg film-coated tablets

Medium pink, 8.5 mm round tablets, debossed with "Lilly" on one side and "4" on the other.

The tablets contain a recessed area on each side.

**4. CLINICAL PARTICULARS**

**4.1 Therapeutic indications**

Rheumatoid arthritis

Olumiant is indicated for the treatment of moderate to severe active rheumatoid arthritis in adult patients who have responded inadequately to, or who are intolerant to one or more disease-modifying anti-rheumatic drugs. Olumiant may be used as monotherapy or in combination with methotrexate (see sections 4.4, 4.5 and 5.1 for available data on different combinations).

Atopic dermatitis

Olumiant is indicated for the treatment of moderate to severe atopic dermatitis in adult patients who are candidates for systemic therapy.

**4.2 Posology and method of administration**

Treatment should be initiated by physicians experienced in the diagnosis and treatment of the conditions for which this medicinal product is indicated.

Posology

*Rheumatoid arthritis*

The recommended dose of baricitinib is 4 mg once daily. A dose of 2 mg once daily is appropriate for patients such as those aged  $\geq 75$  years and may be appropriate for patients with a history of chronic or recurrent infections. A dose of 2 mg once daily may also be considered for patients who have achieved sustained control of disease activity with 4 mg once daily and are eligible for dose tapering (see section 5.1).

*Atopic dermatitis*

The recommended dose of baricitinib is 4 mg once daily. A dose of 2 mg once daily is appropriate for patients such as those aged  $\geq 75$  years and may be appropriate for patients with a history of chronic or recurrent infections. A dose of 2 mg once daily should be considered for patients who have achieved sustained control of disease activity with 4 mg once daily and are eligible for dose tapering (see section 5.1).

Baricitinib can be used with or without topical corticosteroids. The efficacy of baricitinib can be enhanced when given with topical corticosteroids (see section 5.1). Topical calcineurin inhibitors may be used, but should be reserved for sensitive areas only, such as the face, neck, intertriginous and genital areas.

Consideration should be given to discontinuing treatment in patients who show no evidence of therapeutic benefit after 8 weeks of treatment.

*Treatment initiation*

Treatment should not be initiated in patients with an absolute lymphocyte count (ALC) less than  $0.5 \times 10^9$  cells/L, an absolute neutrophil count (ANC) less than  $1 \times 10^9$  cells/L, or who have a hemoglobin value less than 8 g/dL. Treatment may be initiated once values have improved above these limits (see section 4.4).

*Co-administration with OAT3 inhibitors*

The recommended dose is 2 mg once daily in patients taking Organic Anion Transporter 3 (OAT3) inhibitors with a strong inhibition potential, such as probenecid (see section 4.5).

Special populations

*Renal impairment*

The recommended dose is 2 mg once daily in patients with creatinine clearance between 30 and 60 mL/min. Baricitinib is not recommended for use in patients with creatinine clearance  $< 30$  mL/min (see section 5.2).

*Hepatic impairment*

No dose adjustment is required in patients with mild or moderate hepatic impairment. Baricitinib is not recommended for use in patients with severe hepatic impairment (see section 5.2).

#### *Elderly*

Clinical experience in patients  $\geq 75$  years is very limited and in these patients a starting dose of 2 mg is appropriate.

#### *Pediatric population*

The safety and efficacy of baricitinib in children and adolescents aged 0 to 18 years have not yet been established. No data are available.

#### Method of administration

Oral use.

Baricitinib is to be taken once daily with or without food and may be taken at any time of the day.

### **4.3 Contraindications**

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

Pregnancy (see section 4.6).

### **4.4 Special warnings and precautions for use**

#### Infections

Baricitinib is associated with an increased rate of infections such as upper respiratory tract infections compared to placebo (see section 4.8). In rheumatoid arthritis clinical studies, combination with methotrexate resulted in increased frequency of infections compared to baricitinib monotherapy.

The risks and benefits of treatment with baricitinib should be carefully considered prior to initiating therapy in patients with active, chronic or recurrent infections (see section 4.2). If an infection develops, the patient should be monitored carefully and therapy should be temporarily interrupted if the patient is not responding to standard therapy. Treatment should not be resumed until the infection resolves.

#### *Tuberculosis*

Patients should be screened for tuberculosis (TB) before starting therapy. Baricitinib should not be given to patients with active TB. Anti-TB therapy should be considered prior to initiation of treatment in patients with previously untreated latent TB.

#### Hematological abnormalities

Absolute Neutrophil Count (ANC)  $< 1 \times 10^9$  cells/L and Absolute Lymphocyte Count (ALC)  $< 0.5 \times 10^9$  cells/L were reported in clinical trials. Hemoglobin  $< 8$  g/dL was reported in rheumatoid arthritis clinical trials.

Treatment should not be initiated, or should be temporarily interrupted, in patients with an ANC  $< 1 \times 10^9$  cells/L, ALC  $< 0.5 \times 10^9$  cells/L or hemoglobin  $< 8$  g/dL observed during routine patient management (see section 4.2).

The risk of lymphocytosis is increased in elderly patients with rheumatoid arthritis. Rare cases of lymphoproliferative disorders have been reported.

#### Viral reactivation

Viral reactivation, including cases of herpes virus reactivation (e.g., herpes zoster, herpes simplex), were reported in clinical studies (see section 4.8). In rheumatoid arthritis clinical studies, herpes zoster was reported more commonly in patients  $\geq 65$  years of age who had previously been treated with both

biologic and conventional disease-modifying antirheumatic drugs (DMARDs). If a patient develops herpes zoster, treatment should be temporarily interrupted until the episode resolves.

Screening for viral hepatitis should be performed in accordance with clinical guidelines before starting therapy with baricitinib. Patients with evidence of active hepatitis B or C infection were excluded from clinical trials. Patients, who were positive for hepatitis C antibody but negative for hepatitis C virus RNA, were allowed to participate. Patients with hepatitis B surface antibody and hepatitis B core antibody, without hepatitis B surface antigen, were also allowed to participate; such patients should be monitored for expression of hepatitis B virus (HBV) DNA. If HBV DNA is detected, a liver specialist should be consulted to determine if treatment interruption is warranted.

### Vaccination

No data are available on the response to vaccination with live vaccines in patients receiving baricitinib. Use with live, attenuated vaccines during, or immediately prior to baricitinib therapy is not recommended. Prior to initiating treatment, it is recommended that all patients be brought up to date with all immunizations in agreement with current immunization guidelines.

### Lipids

Dose dependent increases in blood lipid parameters were reported in patients treated with baricitinib (see section 4.8). Elevations in low density lipoprotein (LDL) cholesterol decreased to pre-treatment levels in response to statin therapy. Lipid parameters should be assessed approximately 12 weeks following initiation of therapy and thereafter patients should be managed according to international clinical guidelines for hyperlipidaemia.

### Hepatic transaminase elevations

Dose dependent increases in blood alanine transaminase (ALT) and aspartate transaminase (AST) activity were reported in patients treated with baricitinib (see section 4.8).

Increases in ALT and AST to  $\geq 5$  and  $\geq 10$  x upper limit of normal (ULN) were reported in clinical trials. In rheumatoid arthritis clinical studies, combination with methotrexate resulted in increased frequency of hepatic transaminase elevations compared with baricitinib monotherapy (see section 4.8).

If increases in ALT or AST are observed during routine patient management and drug-induced liver injury is suspected, treatment should be temporarily interrupted until this diagnosis is excluded.

### Malignancy

The risk of malignancies including lymphoma is increased in patients with rheumatoid arthritis. Immunomodulatory medicinal products may increase the risk of malignancies including lymphoma. The clinical data are insufficient to assess the potential incidence of malignancies following exposure to baricitinib. Long-term safety evaluations are ongoing.

### Venous thromboembolism

Cases of deep venous thrombosis (DVT) and pulmonary embolism (PE) have been reported in patients receiving baricitinib (see section 4.8). Baricitinib should be used with caution in patients with risk factors for DVT/PE, such as older age, obesity, a medical history of DVT/PE, or patients undergoing surgery and immobilization. If clinical features of DVT/PE occur, treatment should be discontinued and patients should be evaluated promptly, followed by appropriate treatment.

Laboratory monitoring**Table 1. Laboratory measures and monitoring guidance**

<b>Laboratory Measure</b>	<b>Action</b>	<b>Monitoring guidance</b>
Lipid parameters	Patients should be managed according to international clinical guidelines for hyperlipidemia	12 weeks after initiation of treatment and thereafter according to international clinical guidelines for hyperlipidemia
Absolute Neutrophil Count (ANC)	Treatment should be interrupted if ANC < 1 x 10 <sup>9</sup> cells/L and may be restarted once ANC return above this value	Before treatment initiation and thereafter according to routine patient management
Absolute Lymphocyte Count (ALC)	Treatment should be interrupted if ALC < 0.5 x 10 <sup>9</sup> cells/L and may be restarted once ALC return above this value	
Hemoglobin (Hb)	Treatment should be interrupted if Hb < 8 g/dL and may be restarted once Hb return above this value	
Hepatic transaminases	Treatment should be temporarily interrupted if drug-induced liver injury is suspected	

Immunosuppressive medicinal products

Combination with biological DMARDs, biological immunomodulators or other Janus kinase (JAK) inhibitors is not recommended, as a risk of additive immunosuppression cannot be excluded.

In rheumatoid arthritis, data concerning use of baricitinib with potent immunosuppressive medicinal products (e.g., azathioprine, tacrolimus, ciclosporin) are limited and caution should be exercised when using such combinations (see section 4.5).

In atopic dermatitis, combination with ciclosporin or other potent immunosuppressants has not been studied and is not recommended (see section 4.5).

Hypersensitivity

In post-marketing experience, cases of hypersensitivity associated with baricitinib administration have been reported. If any serious allergic or anaphylactic reaction occurs, treatment should be discontinued immediately.

Diverticulitis

Cases of diverticulitis and gastrointestinal perforation have been reported in clinical trials and from postmarketing sources (see section 4.8). Baricitinib should be used with caution in patients with diverticular disease and especially in patients chronically treated with concomitant medicinal products associated with an increased risk of diverticulitis: nonsteroidal anti-inflammatory drugs, corticosteroids, and opioids. Patients presenting with new onset abdominal signs and symptoms should be evaluated promptly for early identification of diverticulitis or gastrointestinal perforation.

Excipients

This medicinal product contains less than 1 mmol sodium (23 mg) per tablet, that is to say, essentially “sodium-free”.

## 4.5 Interaction with other medicinal products and other forms of interaction

### Pharmacodynamic interactions

#### *Immunosuppressive medicinal products*

Combination with biological DMARDs, biological immunomodulators or other JAK inhibitors has not been studied. In rheumatoid arthritis, use of baricitinib with potent immunosuppressive medicinal products such as azathioprine, tacrolimus, or ciclosporin was limited in clinical studies, and a risk of additive immunosuppression cannot be excluded. In atopic dermatitis, combination with ciclosporin or other potent immunosuppressants has not been studied and is not recommended (see section 4.4).

### Potential for other medicinal products to affect the pharmacokinetics of baricitinib

#### *Transporters*

*In vitro*, baricitinib is a substrate for organic anionic transporter (OAT)3, P-glycoprotein (Pgp), breast cancer resistance protein (BCRP) and multidrug and toxic extrusion protein (MATE)2-K. In a clinical pharmacology study, dosing of probenecid (an OAT3 inhibitor with strong inhibition potential) resulted in approximately a 2-fold increase in  $AUC_{(0-\infty)}$  with no change in  $t_{max}$  or  $C_{max}$  of baricitinib. Consequently, the recommended dose in patients taking OAT3 inhibitors with a strong inhibition potential, such as probenecid, is 2 mg once daily (see section 4.2). No clinical pharmacology study has been conducted with OAT3 inhibitors with less inhibition potential. The prodrug leflunomide rapidly converts to teriflunomide which is a weak OAT3 inhibitor and therefore may lead to an increase in baricitinib exposure. Since dedicated interaction studies have not been conducted, caution should be used when leflunomide or teriflunomide are given concomitantly with baricitinib. Concomitant use of the OAT3 inhibitors ibuprofen and diclofenac may lead to increased exposure of baricitinib, however their inhibition potential of OAT3 is less compared to probenecid and thus a clinically relevant interaction is not expected. Coadministration of baricitinib with ciclosporin (Pgp/BCRP inhibitor) or methotrexate (substrate of several transporters including OATP1B1, OAT1, OAT3, BCRP, MRP2, MRP3, and MRP4) resulted in no clinically meaningful effects on baricitinib exposure.

#### *Cytochrome P450 enzymes*

*In vitro*, baricitinib is a cytochrome P450 enzyme (CYP)3A4 substrate although less than 10% of the dose is metabolized via oxidation. In clinical pharmacology studies, coadministration of baricitinib with ketoconazole (strong CYP3A inhibitor) resulted in no clinically meaningful effect on the PK of baricitinib. Coadministration of baricitinib with fluconazole (moderate CYP3A/CYP2C19/CYP2C9 inhibitor) or rifampicin (strong CYP3A inducer) resulted in no clinically meaningful changes to baricitinib exposure.

#### *Gastric pH modifying agents*

Elevating gastric pH with omeprazole had no clinically significant effect on baricitinib exposure.

### Potential for baricitinib to affect the pharmacokinetics of other medicinal products

#### *Transporters*

*In vitro*, baricitinib is not an inhibitor of OAT1, OAT2, OAT3, organic cationic transporter (OCT) 2, OATP1B1, OATP1B3, BCRP, MATE1 and MATE2-K at clinically relevant concentrations. Baricitinib may be a clinically relevant inhibitor of OCT1, however there are currently no known selective OCT1 substrates for which clinically significant interactions might be predicted. In clinical pharmacology studies there were no clinically meaningful effects on exposure when baricitinib was coadministered with digoxin (Pgp substrate) or methotrexate (substrate of several transporters).

#### *Cytochrome P450 enzymes*

In clinical pharmacology studies, coadministration of baricitinib with the CYP3A substrates simvastatin, ethinyl oestradiol, or levonorgestrel resulted in no clinically meaningful changes in the PK of these medicinal products.

## 4.6 Fertility, pregnancy and lactation

### Pregnancy

The JAK/STAT pathway has been shown to be involved in cell adhesion and cell polarity which can affect early embryonic development. There are no adequate data from the use of baricitinib in pregnant women. Studies in animals have shown reproductive toxicity (see section 5.3). Baricitinib was teratogenic in rats and rabbits. Animal studies indicate that baricitinib may have an adverse effect on bone development *in utero* at higher doses.

Baricitinib is contraindicated during pregnancy (see section 4.3). Women of childbearing potential have to use effective contraception during and for at least 1 week after treatment. If a patient becomes pregnant while taking baricitinib the parents should be informed of the potential risk to the fetus.

### Breast-feeding

It is unknown whether baricitinib/metabolites are excreted in human milk. Available pharmacodynamic/toxicological data in animals have shown excretion of baricitinib in milk (see section 5.3).

A risk to newborns/infants cannot be excluded and baricitinib should not be used during breast-feeding. A decision must be made whether to discontinue breast-feeding or to discontinue therapy taking into account the benefit of breast-feeding for the child and the benefit of therapy for the woman.

### Fertility

Studies in animals suggest that treatment with baricitinib has the potential to decrease female fertility while on treatment, but there was no effect on male spermatogenesis (see section 5.3).

## 4.7 Effects on ability to drive and use machines

Baricitinib has no or negligible influence on the ability to drive and use machines.

## 4.8 Undesirable effects

### Summary of safety profile

The most commonly reported adverse reactions with baricitinib are increased LDL cholesterol (25.1%), upper respiratory tract infections (16.7%), headache (4.9%), herpes simplex (3.7%) and urinary tract infections (2.7%). Serious pneumonia and serious herpes zoster occurred uncommonly in patients with rheumatoid arthritis.

### Tabulated list of adverse reactions

Frequency estimate: Very common ( $\geq 1/10$ ), common ( $\geq 1/100$  to  $< 1/10$ ), uncommon ( $\geq 1/1,000$  to  $< 1/100$ ), rare ( $\geq 1/10,000$  to  $< 1/1,000$ ), very rare ( $< 1/10,000$ ). The frequencies in Table 2 are based on integrated data from clinical trials and/or postmarketing setting across both rheumatoid

arthritis and atopic dermatitis indications unless stated otherwise; where notable differences in frequency are observed in one indication alone, these are presented in the footnotes below the table.

**Table 2. Adverse reactions**

System Organ Class	Very common	Common	Uncommon
Infections and infestations	Upper respiratory tract infections	Herpes zoster <sup>b</sup> Herpes simplex Gastroenteritis Urinary tract infections Pneumonia <sup>d</sup>	
Blood and lymphatic system disorders		Thrombocytosis > 600 x 10 <sup>9</sup> cells/L <sup>a, d</sup>	Neutropaenia < 1 x 10 <sup>9</sup> cells/L <sup>a</sup>
Immune disorders			Swelling of the face, Urticaria
Metabolism and nutrition disorders	Hypercholesterolemia <sup>a</sup>		Hypertriglyceridemia <sup>a</sup>
Nervous system disorders		Headache	
Vascular disorders			Deep Vein Thrombosis
Respiratory, thoracic, mediastinal disorders			Pulmonary embolism
Gastrointestinal disorders		Nausea <sup>d</sup> Abdominal pain	Diverticulitis
Hepatobiliary disorders		ALT increased ≥ 3 x ULN <sup>a, d</sup>	AST increased ≥ 3 x ULN <sup>a</sup>
Skin and subcutaneous tissue disorders		Rash Acne <sup>c</sup>	
Investigations		Creatine phosphokinase increased > 5 x ULN <sup>a, c</sup>	Weight increased

<sup>a</sup> Includes changes detected during laboratory monitoring (see text below).

<sup>b</sup> Frequency for herpes zoster is based on rheumatoid arthritis clinical trials.

<sup>c</sup> In rheumatoid arthritis clinical trials, the frequency of acne and creatine phosphokinase increased > 5 x ULN was uncommon.

<sup>d</sup> In atopic dermatitis clinical trials, the frequency of pneumonia, thrombocytosis > 600 x 10<sup>9</sup> cells/L, nausea, and ALT ≥ 3 x ULN was uncommon.

### Description of selected adverse reactions

#### *Gastrointestinal disorders*

In rheumatoid arthritis clinical studies, in treatment-naïve patients, through 52 weeks, the frequency of nausea was greater for the combination treatment of methotrexate and baricitinib (9.3%) compared to

methotrexate alone (6.2%) or baricitinib alone (4.4%). In the integrated data from rheumatoid arthritis and atopic dermatitis clinical trials, nausea was most frequent during the first 2 weeks of treatment.

Cases of abdominal pain were usually mild, transient, not associated with infectious or inflammatory gastrointestinal disorders, and did not lead to treatment interruption.

#### *Infections*

In the integrated data from rheumatoid arthritis and atopic dermatitis clinical trials, most infections were mild to moderate in severity. Frequency of herpes zoster was common in rheumatoid arthritis, and very rare in atopic dermatitis. In atopic dermatitis clinical trials, there were fewer skin infections requiring antibiotic treatment with baricitinib than with placebo.

The incidence of serious infections with baricitinib was similar to placebo. The incidence of serious infections remained stable during long term exposure. The overall incidence rate of serious infections in the clinical trial programme was 3.2 per 100 patient-years in rheumatoid arthritis, and 2.1 in atopic dermatitis. Serious pneumonia and serious herpes zoster occurred uncommonly in patients with rheumatoid arthritis.

#### *Hepatic transaminase elevations*

Dose dependent increases in blood ALT and AST activity were reported in studies extended over week 16. Elevations in mean ALT/AST remained stable over time. Most cases of hepatic transaminase elevations  $\geq 3 \times \text{ULN}$  were asymptomatic and transient.

In patients with rheumatoid arthritis, the combination of baricitinib with potentially hepatotoxic medicinal products, such as methotrexate, resulted in increased frequency of these elevations.

#### *Lipid elevations*

In the integrated data from rheumatoid arthritis and atopic dermatitis clinical trials, baricitinib treatment was associated with dose-dependent increases in lipid parameters including total cholesterol, LDL cholesterol, and high density lipoprotein (HDL) cholesterol. There was no change in the LDL/HDL ratio. Elevations were observed at 12 weeks and remained stable thereafter at a higher value than baseline including in the long-term extension study in rheumatoid arthritis. Total and LDL cholesterol increased through week 52 in patients with atopic dermatitis. In rheumatoid arthritis clinical trials, baricitinib treatment was associated with dose-dependent increases in triglycerides. There was no increase in triglycerides levels in atopic dermatitis clinical trials.

Elevations in LDL cholesterol decreased to pre-treatment levels in response to statin therapy.

#### *Creatine phosphokinase (CPK)*

Baricitinib treatment was associated with dose-dependent increases in CPK. Elevations of mean CPK were observed at 4 weeks and remained stable at a higher value than baseline thereafter. Across indications, most cases of CPK elevations  $\geq 5 \times \text{ULN}$  were transient and did not require treatment discontinuation.

In clinical trials, there were no confirmed cases of rhabdomyolysis.

#### *Neutropenia*

Mean neutrophil counts decreased at 4 weeks and remained stable at a lower value than baseline over time. There was no clear relationship between neutropenia and the occurrence of serious infections. However, in clinical studies, treatment was interrupted in response to  $\text{ANC} < 1 \times 10^9 \text{ cells/L}$ .

#### *Thrombocytosis*

Increases in mean platelet counts were observed and remained stable at a higher value than baseline over time.

#### Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorization of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product.

Any suspected adverse events should be reported to the Ministry of Health according to the National Regulation by using an online form

<https://sideeffects.health.gov.il>

#### **4.9 Overdose**

Single doses up to 40 mg and multiple doses of up to 20 mg daily for 10 days have been administered in clinical trials without dose-limiting toxicity. No specific toxicities were identified. Pharmacokinetic data of a single dose of 40 mg in healthy volunteers indicate that more than 90% of the administered dose is expected to be eliminated within 24 hours. In case of an overdose, it is recommended that the patient be monitored for signs and symptoms of adverse reactions. Patients who develop adverse reactions should receive appropriate treatment.

### **5. PHARMACOLOGICAL PROPERTIES**

#### **5.1 Pharmacodynamic properties**

Pharmacotherapeutic group: Immunosuppressants, selective immunosuppressants, ATC code: L04AA37

#### Mechanism of action

Baricitinib is a selective and reversible inhibitor of Janus kinase (JAK)1 and JAK2. In isolated enzyme assays, baricitinib inhibited the activities of JAK1, JAK2, Tyrosine Kinase 2 and JAK3 with IC<sub>50</sub> values of 5.9, 5.7, 53 and > 400 nM, respectively.

Janus kinases (JAKs) are enzymes that transduce intracellular signals from cell surface receptors for a number of cytokines and growth factors involved in hematopoiesis, inflammation and immune function. Within the intracellular signalling pathway, JAKs phosphorylate and activate signal transducers and activators of transcription (STATs), which activate gene expression within the cell. Baricitinib modulates these signalling pathways by partially inhibiting JAK1 and JAK2 enzymatic activity, thereby reducing the phosphorylation and activation of STATs.

#### Pharmacodynamic effects

##### *Inhibition of IL-6 induced STAT3 phosphorylation*

Administration of baricitinib resulted in a dose dependent inhibition of IL-6 induced STAT3 phosphorylation in whole blood from healthy subjects with maximal inhibition observed 2 hours after dosing which returned to near baseline by 24 hours.

##### *Immunoglobulins*

Mean serum IgG, IgM, and IgA values decreased by 12 weeks after starting treatment, and remained stable at a lower value than baseline through at least 104 weeks. For most patients, changes in immunoglobulins occurred within the normal reference range.

##### *Lymphocytes*

Mean absolute lymphocyte count increased by 1 week after starting treatment, returned to baseline by week 24, and then remained stable through at least 104 weeks. For most patients, changes in lymphocyte count occurred within the normal reference range.

*C-reactive protein*

In patients with rheumatoid arthritis, decreases in serum C-reactive protein (CRP) were observed as early as 1 week after starting treatment and were maintained throughout dosing.

*Creatinine*

In clinical trials, baricitinib induced a mean increase in serum creatinine levels of 3.8 µmol/L after two weeks of treatment, which remained stable thereafter. This may be due to inhibition of creatinine secretion by baricitinib in the renal tubules. Consequently, estimates of the glomerular filtration rate based on serum creatinine may be slightly reduced, without actual loss of renal function or the occurrence of renal adverse reactions. In atopic dermatitis, baricitinib was associated with a decrease in cystatin C (also used to estimate glomerular filtration rate) of 0.1 mg/L at week 4, with no further decrease noted up to week 16.

*In vitro skin models*

In an in-vitro human skin model treated with pro-inflammatory cytokines (i.e., IL-4, IL-13, IL-31), baricitinib reduced epidermal keratinocyte pSTAT3 expression, and increased the expression of filaggrin, a protein that plays a role in skin barrier function and in the pathogenesis of atopic dermatitis.

Vaccine study

The influence of baricitinib on the humoral response to non-live vaccines was evaluated in 106 rheumatoid arthritis patients under stable treatment with baricitinib 2 or 4 mg, receiving inactivated pneumococcal or tetanus vaccination. The majority of these patients (n = 94) were co-treated with methotrexate. For the total population, pneumococcal vaccination resulted in a satisfactory IgG immune response in 68.0% (95% CI: 58.4%, 76.2%) of the patients. In 43.1% (95% CI: 34.0%, 52.8%) of the patients, a satisfactory IgG immune response to tetanus vaccination was achieved.

Clinical efficacy

*Rheumatoid arthritis*

The efficacy and safety of baricitinib once daily were assessed in 4 Phase III randomised, double-blind, multicentre studies in adult patients with moderate to severe active rheumatoid arthritis diagnosed according to the ACR/EULAR 2010 criteria (Table 3). The presence of at least 6 tender and 6 swollen joints was required at baseline. All patients who completed these studies were eligible to enrol in a long term extension study for up to 4 years continued treatment.

**Table 3. Clinical trial summary**

Study name (Duration)	Population (Number)	Treatment arms	Summary of key outcome measures

Abbreviations: QD= Once daily; Q2W= Once every 2 weeks; SC = Subcutaneously; ACR = American College of Rheumatology; SDAI = Simplified Disease Activity Index; HAQ-DI = Health Assessment Questionnaire-Disability Index; mTSS = modified Total Sharp Score  
<sup>1</sup> Patients who had received less than 3 doses of Methotrexate (MTX); naïve to other conventional or biologic DMARDs

<sup>2</sup> Patients who had an inadequate response to MTX (+/- other cDMARDs); biologic-naïve

<sup>3</sup> Patients who had an inadequate response or were intolerant to  $\geq 1$  cDMARDs; biologic-naïve

<sup>4</sup> Patients who had an inadequate response or were intolerant to  $\geq 1$  bDMARDs; including at least one TNF inhibitor

<sup>5</sup> Most common concomitant cDMARDs included MTX, hydroxychloroquine, leflunomide and sulfasalazine

#### *Clinical response*

In all studies, patients treated with baricitinib 4 mg once daily had statistically significantly higher ACR20, ACR50 and ACR70 response at 12 weeks compared to placebo, MTX or adalimumab (Table 4). Time to onset of efficacy was rapid across measures with significantly greater responses seen as early as week 1. Continued, durable response rates were observed, with ACR20/50/70 responses maintained for at least 2 years including the long-term extension study.

Treatment with baricitinib 4 mg, alone or in combination with cDMARDs, resulted in significant improvements in all individual ACR components, including tender and swollen joint counts, patient and physician global assessments, HAQ-DI, pain assessment and CRP, compared to placebo MTX or adalimumab.

No relevant differences regarding efficacy and safety were observed in subgroups defined by types of concomitant DMARDs used in combination with baricitinib.

#### *Remission and low disease activity*

A statistically significantly greater proportion of patients treated with baricitinib 4 mg compared to placebo or MTX achieved remission, (SDAI  $\leq 3.3$  and CDAI  $\leq 2.8$ ) or low disease activity or

X OLUMTB A 08

remission (DAS28-ESR or DAS28-hsCRP  $\leq$  3.2 and DAS28-ESR or DAS28-hsCRP  $<$  2.6), at weeks 12 and 24 (Table 4).

Greater rates of remission compared to placebo were observed as early as week 4. Remission and low disease activity rates were maintained for at least 2 years.

#### *Radiographic response*

The effect of baricitinib on progression of structural joint damage was evaluated radiographically in studies RA-BEGIN, RA-BEAM and RA-BUILD and assessed using the modified Total Sharp Score (mTSS) and its components, the erosion score and joint space narrowing score.

Treatment with baricitinib 4 mg resulted in a statistically significant inhibition of progression of structural joint damage (Table 5). Analyses of erosion and joint space narrowing scores were

consistent with the overall scores. The proportion of patients with no radiographic progression (mTSS change  $\leq 0$ ) was significantly higher with baricitinib 4 mg compared to placebo at weeks 24 and 52.

**Table 5. Radiographic changes**

<sup>b</sup> No progression defined as mTSS change  $\leq 0$ .

\*  $p \leq 0.05$ ; \*\*  $p \leq 0.01$ ; \*\*\*  $p \leq 0.001$  vs. placebo (vs. MTX for study RA-BEGIN)

#### *Physical function response and health-related outcomes*

Treatment with baricitinib 4 mg, alone or in combination with cDMARDs, resulted in a significant improvement in physical function (HAQ-DI) and pain (0-100 visual analogue scale) compared to all comparators (placebo, MTX, adalimumab). Improvements were seen as early as week 1 and, in studies RA-BEGIN and RA-BEAM, this was maintained for up to 52 weeks.

In RA-BEAM and RA-BUILD, treatment with baricitinib 4 mg resulted in a significant improvement in the mean duration and severity of morning joint stiffness compared to placebo or adalimumab as assessed using daily electronic patient diaries.

In all studies, baricitinib-treated patients reported improvements in patient-reported quality of life, as measured by the Short Form (36) Health Survey (SF-36) Physical Component Score and fatigue, as measured by the Functional Assessment of Chronic Illness Therapy-Fatigue score (FACIT-F).

#### *Baricitinib 4 mg vs. 2 mg*

Differences in efficacy between the 4 mg and the 2 mg doses were most notable in the bDMARD-IR population (RA-BEACON), in which statistically significant improvements in the ACR components of swollen joint count, tender joint count and ESR were shown for baricitinib 4 mg compared to placebo at week 24 but not for baricitinib 2 mg compared to placebo. In addition, for both study RA-BEACON and RA-BUILD, onset of efficacy was faster and the effect size was generally larger for the 4 mg dose groups compared to 2 mg.

In a long-term extension study, patients from Studies RA-BEAM, RA-BUILD and RA-BEACON who achieved sustained low disease activity or remission (CDAI  $\leq 10$ ) after at least 15 months of treatment with baricitinib 4 mg once daily were re-randomised 1:1 in a double-blind manner to continue 4 mg once daily or reduce dose to 2 mg once daily. The majority of patients maintained low disease activity or remission based on CDAI score:

- At week 12: 234/251 (93%) continuing 4 mg vs. 207/251 (82%) reduced to 2 mg ( $p \leq 0.001$ )
- At week 24: 163/191 (85%) continuing 4 mg vs. 144/189 (76%) reduced to 2 mg ( $p \leq 0.05$ )
- At week 48: 57/73 (78%) continuing 4 mg vs. 51/86 (59%) reduced to 2 mg ( $p \leq 0.05$ )

The majority of patients who lost their low disease activity or remission status after dose reduction could regain disease control after the dose was returned to 4 mg.

Atopic dermatitis

The efficacy and safety of baricitinib as monotherapy or in combination with topical corticosteroids (TCS) were assessed in 3 Phase III randomised, double-blind, placebo-controlled, 16 week studies (BREEZE-AD1, -AD2, and -AD7). The studies included 1,568 patients with moderate to severe atopic dermatitis defined by Investigator's Global Assessment (IGA) score  $\geq 3$ , an Eczema Area and Severity Index (EASI) score  $\geq 16$ , and a body surface area (BSA) involvement of  $\geq 10\%$ . Eligible patients were over 18 years of age and had previous inadequate response or were intolerant to topical medication. Patients were permitted to receive rescue treatment (which included topical or systemic therapy), at which time they were considered non-responders. At baseline of study BREEZE-AD7, all patients were on concomitant topical corticosteroids therapy and patients were permitted to use topical calcineurin inhibitors. All patients who completed these studies were eligible to enrol in a long term extension study (BREEZE AD-3) for up to 2 years of continued treatment.

The Phase III randomised, double-blind, placebo-controlled BREEZE-AD4 study evaluated the efficacy of baricitinib in combination with topical corticosteroids over 52 weeks in 463 patients with moderate to severe atopic dermatitis with failure, intolerance, or contraindication to oral ciclosporin treatment.

Baseline characteristics

In the placebo-controlled Phase III studies (BREEZE-AD1, -AD2, -AD7, and -AD4), across all treatment groups, 37% were female, 64% were Caucasian, 31% were Asian and 0.6% were Black, and the mean age was 35.6 years. In these studies, 42% to 51% of patients had a baseline IGA of 4 (severe atopic dermatitis), and 54% to 79% of patients had received prior systemic treatment for atopic dermatitis. The baseline mean EASI score ranged from 29.6 to 33.5, the baseline weekly averaged Itch Numerical Rating Scale (NRS) ranged from 6.5 to 7.1, the baseline mean Dermatology Life Quality Index (DLQI) ranged from 13.6 to 14.9, and the baseline mean Hospital Anxiety and Depression Scale (HADS) Total score ranged from 10.9 to 12.1.

Clinical response16-week monotherapy (BREEZE-AD1, -AD2) and TCS combination (BREEZE-AD7) studies

A significantly larger proportion of patients randomised to baricitinib 4 mg achieved an IGA 0 or 1 response (primary outcome), EASI75, or an improvement of  $\geq 4$  points on the Itch NRS compared to placebo at week 16 (Table 6). Figure 1 shows the mean percent change from baseline in EASI up to week 16.

A significantly greater proportion of patients randomised to baricitinib 4 mg achieved a  $\geq 4$ -point improvement in the Itch NRS compared to placebo (within the first week of treatment for BREEZE-AD1 and AD2, and as early as week 2 for BREEZE-AD7;  $p < 0.002$ ).

Treatment effects in subgroups (weight, age, gender, race, disease severity, and previous treatment, including immunosuppressants) were consistent with the results in the overall study population.

### Maintenance of response

To evaluate maintenance of response, 1,373 subjects treated with baricitinib for 16 weeks in BREEZE-AD1 (N = 541), BREEZE-AD2 (N = 540) and BREEZE-AD7 (N = 292) were eligible to enrol in a long term extension study BREEZE-AD3. Data are available up to 68 weeks of cumulative treatment for patients from BREEZE-AD1 and BREEZE-AD2, and up to 32 weeks of cumulative

treatment for patients from BREEZE-AD7. Continued response was observed in patients with at least some response (IGA 0, 1 or 2) after initiating baricitinib.

*Quality of life/patient-reported outcomes in atopic dermatitis*

In both monotherapy studies (BREEZE-AD1 and BREEZE-AD2) and in the concomitant TCS study (BREEZE-AD7), baricitinib 4 mg significantly improved patient-reported outcomes, including itch NRS, sleep (ADSS), skin pain (skin pain NRS), quality of life (DLQI) and symptoms of anxiety and depression (HADS) that were uncorrected for multiplicity, at 16 weeks compared to placebo (See Table 7).

**Table 7. Quality of life/patient-reported outcomes results of baricitinib monotherapy and baricitinib in combination with TCS at week 16 (FAS)<sup>a</sup>**

### Pediatric population

The European Medicines Agency has deferred the obligation to submit the results of studies with baricitinib in one or more subsets of the pediatric population in chronic idiopathic arthritis and atopic dermatitis (see section 4.2 for information on pediatric use).

## **5.2 Pharmacokinetic properties**

Following oral administration of baricitinib, a dose-proportional increase in systemic exposure was observed in the therapeutic dose range. The PK of baricitinib is linear with respect to time.

### Absorption

Following oral administration, baricitinib is rapidly absorbed with a median  $t_{max}$  of approximately 1 hour (range 0.5 - 3.0 h) and an absolute bioavailability of approximately 79% (CV = 3.94%). Food intake led to a decreased exposure by up to 14%, a decrease in  $C_{max}$  by up to 18% and delayed  $t_{max}$  by 0.5 hours. Administration with meals was not associated with a clinically relevant effect on exposure.

### Distribution

Mean volume of distribution following intravenous infusion administration was 76 L, indicating distribution of baricitinib into tissues. Baricitinib is approximately 50% bound to plasma proteins.

### Biotransformation

Baricitinib metabolism is mediated by CYP3A4, with less than 10% of the dose identified as undergoing biotransformation. No metabolites were quantifiable in plasma. In a clinical pharmacology study, baricitinib was excreted predominately as the unchanged active substance in urine (69%) and feces (15%) and only 4 minor oxidative metabolites were identified (3 in urine; 1 in feces) constituting approximately 5% and 1% of the dose, respectively. *In vitro*, baricitinib is a substrate for CYP3A4, OAT3, Pgp, BCRP and MATE2-K, and may be a clinically relevant inhibitor of the transporter OCT1 (see section 4.5). Baricitinib is not an inhibitor of the transporters OAT1, OAT2, OAT3, OCT2, OATP1B1, OATP1B3, BCRP, MATE1 and MATE2-K at clinically relevant concentrations.

### Elimination

Renal elimination is the principal mechanism for baricitinib's clearance through glomerular filtration and active secretion via OAT3, Pgp, BCRP and MATE2-K. In a clinical pharmacology study, approximately 75% of the administered dose was eliminated in the urine, while about 20% of the dose was eliminated in the feces.

Mean apparent clearance (CL/F) and half-life in patients with rheumatoid arthritis was 9.42 L/hr (CV = 34.3%) and 12.5 hrs (CV = 27.4%), respectively.  $C_{max}$  and AUC at steady state are 1.4- and 2.0-fold higher, respectively, in subjects with rheumatoid arthritis compared to healthy subjects.

Mean apparent clearance (CL/F) and half-life in patients with atopic dermatitis was 11.2 L/hr (CV = 33.0%) and 12.9 hrs (CV = 36.0%), respectively.  $C_{max}$  and AUC at steady state in patients with atopic dermatitis are 0.8-fold those seen in rheumatoid arthritis.

### Renal impairment

Renal function was found to significantly affect baricitinib exposure. The mean ratios of AUC in patients with mild and moderate renal impairment to patients with normal renal function are 1.41 (90% CI: 1.15-1.74) and 2.22 (90% CI: 1.81-2.73), respectively. The mean ratios of  $C_{max}$  in patients with mild and moderate renal impairment to patients with normal renal function are 1.16 (90% CI: 0.92-1.45) and 1.46 (90% CI: 1.17-1.83), respectively. See section 4.2 for dose recommendations.

### Hepatic impairment

There was no clinically relevant effect on the PK of baricitinib in patients with mild or moderate hepatic impairment. The use of baricitinib has not been studied in patients with severe hepatic impairment.

### Elderly

Age  $\geq$  65 years or  $\geq$  75 years has no effect on baricitinib exposure ( $C_{max}$  and AUC).

### Pediatric population

The safety, efficacy and pharmacokinetics of baricitinib have not yet been established in a pediatric population (see section 4.2).

### Other intrinsic factors

Body weight, sex, race, and ethnicity did not have a clinically relevant effect on the PK of baricitinib. The mean effects of intrinsic factors on PK parameters (AUC and  $C_{max}$ ) were generally within the inter-subject PK variability of baricitinib. Therefore, no dose adjustment is needed based on these patient factors.

### 5.3 Preclinical safety data

Non-clinical data reveal no special hazard for humans based on conventional studies of safety pharmacology, genotoxicity and carcinogenic potential.

Decreases in lymphocytes, eosinophils and basophils as well as lymphoid depletion in organs/tissues of the immune system were observed in mice, rats and dogs. Opportunistic infections related to demodicosis (mange) were observed in dogs at exposures approximately 7 times the human exposure. Decreases in red blood cell parameters were observed in mice, rats and dogs at exposures approximately 6 to 36 times the human exposure. Degeneration of the sternal growth plate was observed in some dogs, at low incidence and also in control animals, but with a dose-effect relationship regarding severity. At present it is not known whether this is clinically relevant.

In rat and rabbit reproductive toxicology studies, baricitinib was shown to reduce fetal growth/weight and produce skeletal malformations (at exposures of approximately 10 and 39 times the human exposure, respectively). No adverse fetal effects were observed at exposures 2 times the human exposure based on AUC.

In a combined male/female rat fertility study, baricitinib decreased overall mating performance (decreased fertility and conception indices). In female rats there were decreased numbers of corpora lutea and implantation sites, increased pre-implantation loss, and/or adverse effects on intrauterine survival of the embryos. Since there were no effects on spermatogenesis (as assessed by histopathology) or semen/sperm endpoints in male rats, the decreased overall mating performance was likely the result of these female effects.

Baricitinib was detected in the milk of lactating rats. In a pre- and postnatal development study, decreased pup weights and decreased postnatal survival were observed at exposures 4 and 21 times, respectively, the human exposure.

## 6. PHARMACEUTICAL PARTICULARS

### 6.1 List of excipients

#### Tablet cores

- cellulose, microcrystalline
- mannitol
- croscarmellose sodium
- magnesium stearate (vegetable)

#### Film coating, color mixture pink 85G140008 (2 mg) /85G140009 (4 mg):

- polyvinyl alcohol
- titanium dioxide
- macrogol
- talc
- lecithin
- iron oxide red

### 6.2 Incompatibilities

Not applicable.

X OLUMTB A 08

### **6.3 Shelf life**

The expiry date of the product is indicated on the packaging materials.

### **6.4 Special precautions for storage**

Store below 30°C.

### **6.5 Nature and contents of container**

Polyvinylchloride/polyethylene/polychlorotrifluoroethylene - aluminium blisters in cartons of 14, 28, 35, 56, 84 or 98 film-coated tablets.

Not all pack sizes may be marketed.

### **6.6 Special precautions for disposal**

No special requirements for disposal.
