## PATIENT PACKAGE INSERT IN ACCORDANCE WITH THE PHARMACISTS' REGULATIONS (PREPARATIONS) – 1986

The medicine is dispensed with a doctor's prescription only

### Dovato

### Film-Coated Tablets

Each tablet contains:

### dolutegravir (as sodium) 50 mg lamivudine 300 mg

For the list of inactive and allergenic ingredients, see section 2 – "Important information about some of the ingredients of the medicine" and section 6 – "Further information".

Read the leaflet carefully in its entirety before using the medicine. This leaflet contains concise information about the medicine. If you have further questions, refer to the doctor or pharmacist. This medicine has been prescribed for you. Do not pass it on to others. It may harm them even if it seems to you that their medical condition is

1. WHAT IS THE MEDICINE INTENDED FOR?

Dovato is indicated for the treatment of HIV-1 (human immunodeficiency virus) infection in adults and adolescents above 12 years of age weighing at least 40 kg, with no known or suspected resistance to the integrase inhibitors class or to lamivudine, and with viral load that does not exceed 500,000 copies per mL. Therapeutic group

Dovato contains two active ingredients used to treat human immunodeficiency virus (HIV): dolutegravir and lamivudine. Dolutegravir belongs to a group of anti-retroviral medicines called *integrase inhibitors* (INIIs), and lamivudine belongs to a group of anti-retroviral medicines called *nucleoside analogue reverse transcriptase inhibitors* (NRTIs). Dovato does not cure HIV infection; it keeps the amount of virus in your body at a low level. This helps maintain the number of CD4 cells in your blood. CD4 cells are a type of white blood cells that are important in helping your body fight

infection. Not everyone responds to treatment with Dovato in the same way. Your doctor will monitor the effectiveness of your treatment.

2. BEFORE USING THE MEDICINE Do not use the medicine if: you are **allergic** (sensitive) to dolutegravir or lamivudine or to any of the other ingredients contained in the medicine (listed in section 6).

- you are taking a medicine called **fampridine**, used to treat multiple sclerosis. Tell the doctor if you think any of these apply
- Special warnings regarding use of the medicine
- Some people taking Dovato or other combination treatments for HIV are more at risk of developing serious side effects than others. You need to be aware of the extra risks: • if you have moderate or severe liver disease

 if you have ever had a liver disease, including hepatitis B or C (if you have hepatitis B, do not stop using Dovato without consulting with your doctor, as your hepatitis may come back) • if you have a kidney problem

— Talk to your doctor before using Dovato
if any of these apply to you. You may need
additional check-ups, including blood tests,
while you are taking your medicine. See section
4 — "Side effects" for more information.

Allergic reactions Dovato contains dolutegravir. Dolutegravir can cause a serious allergic reaction known as a

hypersensitivity reaction. You need to know about important signs and symptoms to look out for while you are taking Dovato. →Read the information "Allergic reactions" in section 4 of this leaflet. ook out for important symptoms

Some people taking medicines for HIV infection develop other conditions, which can be serious. These include: symptoms of infections and inflammation joint pain, stiffness and bone problems

## You need to know about important signs and symptoms to look out for while you are taking Dovato.

Read the information "Other possible side effects" in section 4 of this leaflet. Protect other people

by sharing injection needles). You can still pass on HIV when taking this medicine, although the risk is lowered by effective anti-retroviral therapy. Discuss with your doctor the precautions needed to avoid infecting other people.

HIV infection is spread through sexual contact with a person who carries the infection or through the transmission of contaminated blood (for example,

This medicine is not intended for use in children under 12 years of age, because it has not been studied in these patients. Drug interactions If you are taking, if you have recently taken, or if you plan to take any other medicines, including non-prescription medicines and nutritional supplements, tell the doctor or pharmacist.

### Do not take Dovato with the following medicine:

• fampridine, used to treat multiple sclerosis. Some medicines can affect how Dovato works or make it more likely that you will experience side effects. Dovato can also affect how some other medicines work.

**Tell your doctor** if you are taking any of the medicines from the following list:

metformin, to treat diabetes

 medicines called antacids, to treat indigestion and heartburn. Do not take an antacid during the 6 hours before you take Dovato, or for at least 2 hours after you take it least 2 hours after you take it nutritional supplements or multivitamins containing calcium, iron or magnesium. If you take Dovato with food, you can take nutritional supplements or multivitamins containing calcium, iron or magnesium at the same time as Dovato. If you do not take Dovato with food, do not take a nutritional supplement or multivitamin containing calcium, iron or magnesium during the 6 hours before you take Dovato, or for at least 2 hours after you take it emtricitabine. etravirine, efavirenz, nevirapine

emtricitabine, etravirine, efavirenz, nevirapine or tipranavir/ritonavir, to treat **HIV infection** 

 medicines (usually liquids) containing sorbitol and other sugar alcohols (such as xylitol, mannitol, lactitol or maltitol), if taken regularly cladribine, used to treat leukaemia or multiple sclerosis rifampicin, to treat tuberculosis (TB) and other bacterial infections phenytoin and phenobarbital, to treat epilepsy oxcarbazepine and carbamazepine, to treat epilepsy or bipolar disorder St. John's wort (*Hypericum perforatum*), a herbal medicine to treat **depression**.

Tell your doctor or pharmacist if you are taking any of these medicines. Your doctor may decide to adjust your dose or decide that you need extra check-ups.

Taking Dovato at the time of becoming pregnant or during the first 6 weeks of pregnancy, may increase the risk of a birth defect called neural tube defect, such as spina bifida (malformed

If you are pregnant, think you may be pregnant, or if you are planning a pregnancy:

If you could get pregnant while taking Dovato:

A small amount of the ingredients in Dovato can also pass into your breast milk. If you are breast-feeding, or thinking about breastfeeding:

This medicine contains less than 1 mmol sodium

Swallow the tablet with a little liquid. Dovato can be taken with or without food.

## The recommended dosage is **one tablet** of Dovato **once a day**.

once a day. Do not exceed the recommended dosage. If you accidentally took a higher dosage

4. SIDE EFFECTS

Allergic reactions

hypersensitivity reaction.

 skin rash fever

- lack of energy (fatigue)
- swelling, sometimes of the face or mouth (angioedema), causing difficulty in breathing
   muscle or joint aches. Refer to a doctor straight away. Your doctor may decide to carry out tests to check your liver, kidneys or blood, and may instruct you to stop
- taking Dovato. Very common side effects These may affect more than 1 in 10 people: headache

### nausea. Common side effects

- These may affect up to 1 in 10 people: depression (feelings of deep sadness and
- unworthiness
- rash

diarrhoea

- itching (pruritus) vomiting
- abdominal pain or discomfort wind (flatulence) dizziness
- feeling drowsy difficulty sleeping (insomnia) abnormal dreams
- lack of energy (fatigue) hair loss
- joint pain muscle pain. Common side effects that may show up in blood
- increase in the level of liver enzymes (aminotransferases)

panic attack.

amylase.

tests: failure

 headache stomach ache difficulty breathing.

a long time

if they drink alcohol

• if they are overweight. Signs of osteonecrosis include:

· stiffness in the joints

Tell your doctor.

Very rare side effects

tests:

anxiety

increase in the level of enzymes produced in the muscles (*creatine phosphokinase*). Uncommon side effects These may affect up to 1 in 100 people:

inflammation of the liver (hepatitis)

before). suicidal thoughts (particularly in patients who have had depression or mental health problems before)

suicidal attempt (particularly in patients who have had depression or mental health problems

Uncommon side effects that may show up in blood tests: · a decreased number of cells involved in blood clotting (thrombocytopenia)

a low red blood cell count (anaemia) or low white blood cell count (neutropenia).

 liver failure (signs may include yellowing of the skin and the whites of the eyes or unusually dark swelling, sometimes of the face or mouth (angioedema), causing difficulty in breathing

These may affect up to 1 in 1,000 people:

## suicide (particularly in patients who have had depression or mental health problems before).

inflammation of the pancreas (pancreatitis)

breakdown of muscle tissue

**Tell your doctor immediately** if you experience any mental health problems (see also other mental health problems above). Rare side effects that may show up in blood tests: increase in bilirubin (a test of liver function) increase in the levels of an enzyme called

 lactic acidosis (excess lactic acid in the blood) numbness, tingly feelings in the skin (like "pins and needles") sensation of weakness in the limbs. A very rare side effect that may show up in blood

These may affect up to 1 in 10,000 people:

Other possible side effects People taking combination therapy for HIV may suffer from other side effects.

blood cells (pure red cell aplasia)

Symptoms of infection and inflammation
People with advanced HIV infection or AIDS
have weak immune systems, and are more
likely to develop serious infections (opportunistic
infections). Such infections may have been "silent"
and not detected by the weak immune system
before treatment was started. After starting
treatment, the immune system becomes stronger,
and may attack the infections, which can cause
symptoms of infection or inflammation. Symptoms
usually include fever, plus some of the following:

• headache

- In rare cases, as the immune system becomes stronger, it can also attack healthy body tissue (autoimmune disorders). The symptoms of autoimmune disorders may develop many months after you start taking medicine to treat your HIV infection. Symptoms may include:

   nalnitations (rapid or irregular heartheat) or palpitations (rapid or irregular heartbeat) or tremor hyperactivity (excessive restlessness and movement) weakness beginning in the hands and feet and moving up towards the trunk of the body. If you develop any symptoms of infection or if you notice any of the symptoms above:

  → Tell your doctor immediately. Do not take other medicines for the infection without your doctor's advice.
- develop a condition called osteonecrosis (bone infarction). With this condition, parts of the bone tissue are permanently damaged because of reduced blood supply to the bone. People may be more likely to develop this condition: • if they have been taking combination therapy for

if they are also taking anti-inflammatory medicines called corticosteroids

• if their immune system is very weak

Joint pain, stiffness and bone problems Some people taking combination therapy for HIV

aches and pains in the joints (especially in the hip, knee or shoulder) difficulty moving. If you notice any of these symptoms:

Weight, blood lipid and blood sugar effects

During HIV therapy, there may be an increase in weight and in levels of blood lipids and glucose. These effects are partly linked to restored health and lifestyle, and in the case of blood lipids, sometimes to the HIV medicines themselves. Your doctor will test for these changes.

If a side effect occurs, if one of the side effects worsens or if you suffer from a side effect not mentioned in this leaflet, consult the doctor.

Side effects can be reported to the Ministry of Health by clicking on the link "Report Side Effects of Drug Treatment" found on the Ministry of Health homepage (www.health.gov.il) that directs you

https://sideeffects.health.gov.il

entering the link:

Reporting side effects

5. HOW SHOULD THE MEDICINE BE STORED? Avoid poisoning! This medicine and any other medicine must be kept in a safe place out of the reach and sight of children and/or infants to avoid poisoning. Do not induce vomiting unless explicitly instructed to do so by the doctor.

Do not use the medicine after the expiry date (exp. date) that appears on the package. The expiry date refers to the last day of that month. Store below 30°C.

Do not discard medicines via wastewater or household waste. Consult with the pharmacist on how to throw away medicines that are not in use. These steps will help protect the participant.

to the online form for reporting side effects, or by

microcrystalline cellulose, mannitol, sodium starch glycolate (Type A), povidone (K29/32), sodium stearyl fumarate, magnesium stearate, hypromellose (E464), titanium dioxide (E171), macrogol.

What the medicine looks like and the contents

Dovato film-coated tablets are oval, biconvex, white tablets debossed with the code "SV 137"

The tablets are provided in bottles closed with a

### Each bottle contains 30 tablets. Instructions for opening the bottle: To remove the cap, simultaneously press down and turn left

Instructions for closing the bottle: Place the cap on the opening of the bottle and turn right (clockwise) until fully closed.
